Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- ^p preliminary figures.
- ^r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

Note

Due to reliability concerns, the average expenditure and percentage not reporting zero have been replaced by “...” in the tables for items reported by fewer than 30 households. This suppression criterion should not restrict valid use of the data since these items would normally have coefficients of variation of 30% or more. This symbol should not be interpreted as zero. The expenditure items are components of more reliable higher aggregates.

Acknowledgement

This publication was prepared by the Expenditure Surveys Section, Income Statistics Division.

The paper used in this publication meets the minimum requirements of American National Standard for Information Sciences – Permanence of Paper for Printed Library Materials, ANSI Z39.48 – 1984.

Highlights

Highlights of Household Spending, Dwelling Characteristics and Household Facilities in 2000

Canadian households spent an average of \$55,830 in 2000 on everything from shelter to travel, allocating more to vehicle purchases and energy costs than in previous years. On average, households spent about 4% more in 2000, a year of strong economic growth. The increase in household spending marginally exceeded the inflation rate of 3% in 2000 as measured by the Consumer Price Index (CPI).

Personal taxes accounted for an estimated 22% of the household budget, while shelter costs claimed about 19%, and food 11%. These proportions were virtually unchanged from 1999. Fourteen percent of the household budget was allocated to transportation, continuing the slight increase noted last year.

Vehicle purchases, gas prices drove transportation spending higher

Spending on all types of transportation averaged \$7,580 per household, a 10% increase from 1999, compared to an 8% increase the year before. The increase was mainly due to higher spending on the purchase of all types of new and used vehicles, especially trucks, vans and sport utility vehicles. The 8% of households purchasing trucks or vans in 2000 reported spending \$15,970 on average. The 10% of households leasing a vehicle reported spending just under \$5,000, approximately the same as the year before.

Higher transportation spending was also due to an increase in spending on gasoline. Households with gasoline expenditures spent an average of \$1,950 in 2000, compared to \$1,700 in 1999. (The price of gasoline as measured by the CPI rose 22% in 2000.)

Higher heating costs in 2000

Overall spending on shelter rose slightly, up 3% from 1999 to \$10,500 on average. This figure includes spending on heating fuels such as oil and gas, which increased 20% to an annual average of \$1,000 for those households reporting. (For some households, heat is included in rent.)

Households spent an estimated \$6,220 on food, including spending on restaurant meals, up 2% from 1999. They also paid an average of \$12,010 in personal taxes (excluding sales tax), 4% more than in 1999.

Spending on communications technology continued upward trend

The proportion of households having a cell phone increased in 2000, from 32% to 42%. Average spending on cellular services for those reporting was up 5% to \$480. Spending on telephone services increased slightly to an average of \$720 for the 98% of households reporting.

Forty-two per cent of households reported Internet use from home in 2000. This compares to 33% in 1999, 25% in 1998, and 17% in 1997. Households with Internet services spent an average of \$280, an increase of 7% over the year before.

The percentage of households that purchased new computers and related hardware continued to rise in 2000, from 15% to 18%. Households that purchased new computers reported spending \$1,570 on average in 2000 compared to \$1,600 in 1999, as prices for these items fell. The percentage of households owning computers continued to rise, reaching an estimated 55% by the end of 2000.

Spending on cable and satellite services for the three-quarters of Canadian households with these services increased by 7% to an average of \$480.

Average spending on tourism up in 2000

Households spent more on tourist-related accommodation and transportation in 2000 than they did the previous year. For the 22% of households reporting expenditures on air transportation in 2000, average spending increased 15% to \$1,600, while the cost of air travel as measured by the CPI rose 3%. Similarly, for the 11% of households reporting expenditures on package travel tours, average spending rose 16% to \$2,780. In addition, average household spending on hotel and motel accommodation was up 13% from 1999 to almost \$900 for those households reporting.

Food and shelter costs accounted for half the spending in lowest-income households

In 2000, food and shelter accounted for half of the budget for households in the lowest income quintile, and personal income taxes for 3%. In contrast, households in the highest income quintile allocated only one-quarter of their budgets to food and shelter, and 30% to personal income taxes. These proportions were unchanged from 1999.

The total expenditure of the one-fifth of households with the lowest incomes averaged \$18,090 compared with \$113,030 for the one-fifth of households with the highest incomes.

After adjusting for differences in household size, average spending per person was \$14,890 for households in the lowest income quintile and \$58,290 for households in the highest income quintile.

Average spending on food was an estimated \$2,640 per person for the lowest income quintile and \$4,980 per person for households in the highest income quintile. Similarly, spending on shelter was \$4,630 per person for the one-fifth of households with the lowest incomes and \$8,820 per person for the one-fifth of households with the highest incomes.

Spending on all types of insurance also increasing

Homeowners reported spending \$470 in 2000 on home insurance, a 4% increase over 1999. There was a similar increase in spending on vehicle insurance. Vehicle owners spent \$1,140 to insure their vehicles compared to \$1,090 the year before.

For the 53% of Canadian households reporting spending on health insurance premiums, the average expenditure rose 12% to \$790 in 2000. Health insurance premiums include payments to public hospital, medical and drug plans for which charges are levied in some provinces and for some groups of the population. They also include payments to private plans that provide dental, accident, disability, and travel coverage.

For the 74% of households contributing to either the Canada Pension Plan or the Quebec Pension Plan, the average amount paid in 2000 rose to \$1,570, up from \$1,390 in 1999. Payments on Employment Insurance premiums, however, fell slightly (2%) to \$1,040.

Average household spending highest in Ontario and Alberta

In 2000, Ontario and Alberta households had the highest average expenditure of all provinces. Newfoundland continued to have the lowest average, \$43,240.

Introduction

This report presents the results of the 2000 Survey of Household Spending¹, conducted January through March 2001. Information about the spending habits, dwelling characteristics and household equipment of Canadian households was obtained by asking people across Canada to recall their expenditures for the previous calendar year and their dwelling characteristics and household equipment at the end of 2000.

For 2000, the survey was not conducted in the northern territories. Therefore, Canada level tables represent the 10 provinces only. The 2001 survey will be conducted in the north.

This report is organized into the following sections:

- Four analytical articles covering recent trends; the effect of income on spending patterns; regional variations (with a focus on Quebec); spending patterns, and dwelling characteristics and household equipment for different types of households.
- Graphs for each summary level expenditure category by province and metropolitan area.
- Data tables presenting information for provinces, metropolitan areas, income quintiles, housing tenure and various types of households. These tables present information at the summary level but are also available on a cost-recovery basis at the detailed level. See Table 8 for a detailed table showing average expenditures for Canada.
- Survey notes and definitions. A more detailed User Guide (catalogue number 62F0026MIE) is available free of charge by visiting the Statistics Canada web site (www.statcan.ca). See Related Products and Services for information about obtaining this guide.

We welcome your comments, questions, and suggestions for future articles. Please contact Client Services at: income@statcan.ca or 1-888-297-7355.

¹ Starting with the 1997 reference year, the Survey of Household Spending replaced the Family Expenditure Survey and the Household Facilities and Equipment Survey. See Note to former users of data from the Family Expenditure Survey and Note to former users of data from the Household Facilities and Equipment Survey (catalogue number 62F0026MIE) for more information.

Recent Trends

Average household spending in Canada rose 4.5% between 1999 and 2000, from \$53,446 to \$55,834¹. This increase exceeded the annual inflation rate of nearly 2% for 2000 as measured by the Consumer Price Index, and was slightly less than the increase in average household income (5%).

Personal taxes claimed 22% of the average household's budget, while shelter followed at 19%. Transportation and food took 14% and 11% respectively. Between 1997 and 2000, the percentage of the total household budget devoted to shelter decreased slightly, while the percentage devoted to transportation increased.

Figure 1.1
Budget Share Devoted to Four Largest Spending Categories, Canada, 1997-2000

Vehicle purchases, gas prices drove transportation spending higher

Spending on all types of transportation averaged \$7,576 per household, a 10% increase from 1999, compared with an 8% increase in 1998. The increase was mainly due to higher spending on the purchase of all types of new and used vehicles, especially trucks, vans and sport utility vehicles. The 8% of households purchasing trucks or vans in 2000 reported spending an average \$15,971. The 10% of households leasing a vehicle reported spending just under \$5,000, approximately the same as in 1999.

¹ All expenditure values quoted in this chapter are in current dollars.

Figure 1.2

Budget Share by Summary Spending Category, Canada, 1997-2000

	1997	1998	1999	2000
	%			
Food	11.4	11.5	11.4	11.1
Shelter	19.6	19.7	19.2	18.8
Household operation	4.6	4.6	4.5	4.5
Household furnishings and equipment	2.7	2.9	2.8	2.8
Clothing	4.4	4.3	4.3	4.2
Transportation	12.5	12.5	12.9	13.6
Health care	2.3	2.3	2.4	2.4
Personal care	1.3	1.3	1.3	1.3
Recreation	5.6	5.7	5.5	5.7
Reading materials and other printed matter	0.5	0.5	0.5	0.5
Education	1.4	1.4	1.4	1.5
Tobacco products and alcoholic beverages	2.3	2.4	2.2	2.2
Games of chance (net)	0.5	0.5	0.5	0.5
Miscellaneous expenditures	1.6	1.6	1.6	1.5
Personal taxes	21.3	21.1	21.6	21.5
Personal insurance payments and pension contributions	5.5	5.4	5.3	5.6
Gifts of money and contributions	2.5	2.2	2.5	2.3

Higher transportation spending was also due to higher spending on gasoline. Households with gasoline expenditures spent an average of \$1,953 in 2000, compared with \$1,715 in 1999. The price of gasoline as measured by the CPI rose 22% in 2000.

Spending on vehicle insurance premiums (both public and private) rose to almost 13% in 2000 to an average payment of \$1,145 for those households with this expenditure.

Spending on heating costs also higher in 2000

Spending on shelter rose a slight 3% from 1999 to an average \$10,498. This figure includes spending on heating fuels such as oil and gas, which climbed 20% to an annual average of \$998 for those households reporting. For some households, heat is included in rent.

Households spent an estimated \$6,217 on food, including restaurant meals, up 2% from 1999. They also paid an average of \$12,012 in personal taxes (excluding sales tax), 4% more than in 1999.

Average spending on tourism up in 2000

Households spent more on tourist-related accommodation and transportation in 2000 than they did in 1999. For the 22% of households reporting expenditures on air transportation in 2000, average spending rose 15% to \$1,604, while the cost of air travel as measured by the CPI was up only 3%. For the 11% of households reporting expenditures on package travel tours, average spending rose 16% to \$2,783. In addition, average household spending on hotel and motel accommodation was almost \$898 for those households reporting, up 13% from 1999.

Households spending more on health care

Average household spending on health care in Canada rose approximately 7% due largely to a 15% increase in spending on health insurance premiums, especially private health insurance such as dental plans and accident and disability insurance. The approximately 38% of households with these payments paid an estimated average of \$760 in 2000.

The rise in health care spending is also due to increased spending on prescription medicines and prescription eye wear. Spending on prescription medicines for those households reporting rose 12% to an average of \$344. Households with expenditures on prescription eyewear spent \$316 in 2000 - 8% more than in 1999.

Figure 1.3

Average Expenditure per Household by Summary Spending Category, Canada, 1999-2000

Computers and the Internet increasingly part of our lives

Computer ownership has increased steadily at approximately 3 percentage points per year since 1986, the first year data were collected. By the end of 2000, fully 55% of households had a computer at home, compared to only 10% in 1986. Access to the Internet has grown even more rapidly. By the end of 2000, 42% of households were connected from their homes, up from 33% the year before, and 7% in 1996, the first year this information was collected.

Figure 1.4
Percentage of Households with Computer and Internet Access, Canada, 1986-2000

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey. Data for December 1997 on are from the Survey of Household Spending.

In 2000, 20% of households reported spending on computer hardware, up slightly from 1999. This compares to 14% in 1997 and only 3% in 1986. Average expenditure for 2000 was \$1,468 - similar to the amount reported in 1999 and remaining lower than the high of \$1,887 reported in 1996. Prices for computer equipment and supplies as measured by the consumer price index fell by almost 60% between 1996 and 2000.

Figure 1.5
Percentage of Households Spending on Computer Hardware, Canada, 1986-2000

Cell phone ownership continues to grow ...

Cell phones hit the home market in the late 1980's, and data were first collected in 1996. By the end of 2000, 42% of households reported having a cell phone compared to 14% in May 1996. Average spending on cellular services for those reporting has remained relatively stable for the past few years, at approximately \$40 per month.

Figure 1.6
Percentage of Households with Cell Phones, Canada, 1996-2000

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey and data for December 1997 on are from the Survey of Household Spending.

Long-term trends in possession of home entertainment equipment...

Over the last 22 years, Canadian households have adopted a variety of new types of home entertainment equipment. A colour television can now be found in almost every household. On the other hand, after growing steadily in the 1980's, the percentage of households with cable TV may have peaked in 1997 at slightly less than 75%. The percentage of households with video recorders and CD players at the end of 2000 was 90% and 74% respectively.

Figure 1.7
Percentage of Households with Selected Home Entertainment Equipment, Canada, 1977-2000

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey and data for December 1997 on are from the Survey of Household Spending.

...and of home appliances

Most home appliances have shown slow but steady growth since 1977. The exception is the microwave oven, which has been adopted more rapidly and more extensively than costlier or less portable items such as air conditioning or dishwashers.

Figure 1.8

Percentage of Households with Selected Home Appliances, Canada, 1977-2000

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey and data for December 1997 on are from the Survey of Household Spending.

The Effect of Income Level

Household spending patterns are strongly influenced by available income. In 2000, households in the lowest quintile¹ spent an average of \$18,090 while households in the top quintile spent \$113,027. Households in the lowest quintile spent slightly less than half of their budgets on food and shelter (\$8,836). In contrast, households in the top quintile spent \$26,758 on these two necessities, representing approximately one quarter of their budgets. Households in the top income quintile devoted 30% of their budgets to personal taxes, compared to only 3% for households in the lowest quintile.

While there was a large difference between quintiles in spending on transportation (\$2,084 for the lowest quintile compared to \$14,639 for the top quintile), the budget share devoted to transportation was similar for all income groups.

Figure 2.1
Percentage of Household Budget Spent on Four Major Categories,
Canada, 2000

¹ An income quintile is a grouping based on income level obtained by ranking households in ascending order of total household income and partitioning them into five groups such that the estimated number of households in each group is the same.

Figure 2.2

Average Expenditure by Income Quintile, Canada, 2000

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
	\$				
Food	3,211	4,817	6,104	7,301	9,652
Shelter	5,625	7,439	9,703	12,618	17,106
Transportation	2,084	4,409	7,041	9,704	14,639
Personal taxes	530	3,290	7,843	14,106	34,292
Other categories	6,640	11,510	17,650	24,521	37,338
Total expenditure	18,090	31,465	48,341	68,250	113,027

Adjusting spending data for household size yields a more realistic picture

Household spending patterns are affected not only by income but also by household size. On average, higher income households are larger than lower income households. Households in the lowest income quintile averaged 1.5 persons, compared to 3.5 persons for households in the top quintile. Furthermore, 62% of households in the lowest income quintile were composed of people living alone, as compared to only 4% for those in the top quintile. After adjusting for household size², the estimate for average spending by households in the highest quintile was reduced from six to four times that of households in the lowest quintile.

Figure 2.3

Average Expenditure Adjusted for Household Size by Income Quintile, Canada, 2000

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
	\$				
Food	2,643	3,302	3,773	4,113	4,978
Shelter	4,630	5,099	5,997	7,109	8,822
Transportation	1,715	3,022	4,352	5,467	7,550
Personal taxes	436	2,255	4,847	7,947	17,685
Other categories	5,465	7,889	10,909	13,815	19,256
Total expenditure	14,889	21,566	29,877	38,451	58,291

² The household size adjustment reflects the principle that family needs increase with family size. The adult equivalence scales chosen were those used for the Low Income Measures (LIM, Catalogue no. 13-582). Each additional adult is assumed to increase the family's 'needs' by 40% of the 'needs' of the first adult, and each child's 'needs' are assumed to be 30% of those of the first adult. One exception is for households composed of one adult and one or more children. In that case, the first child is assumed to increase the family's 'needs' by 40%, instead of 30%. The following adult equivalent household sizes were used to adjust the unrounded expenditure data by quintile (lowest to the top quintile): 1.215, 1.459, 1.618, 1.775 and 1.939.

Figure 2.4
Total Expenditure Unadjusted and Adjusted for Household Size by Income Quintile,
Canada, 2000

Using estimates adjusted for household size, spending on basic needs such as food and shelter by the highest income households was only twice that of lowest income households. But for categories such as personal taxes or insurance payments/pension contributions, the highest income households spent 41 and 17 times, respectively, more than the lowest income households.

In addition to household size, there are other important differences in average household characteristics between households in the highest and lowest income quintiles. For instance, 92% of households in the top quintile have one or more full-time earner, compared to only 8% for households in the lowest quintile. Demographic differences between quintiles are also a factor – only 4% of top quintile households have a reference person older than 65, compared to 42% for households in the lowest quintile. Furthermore, 87% of households in the top quintile are husband-wife households, compared to only 20% of households in the lowest quintile.

Figure 2.5
Expenditure Ratio, Highest to Lowest Income Quintile, Canada, 2000

Spending ratio (highest quintile divided by lowest quintile)

Highest income households four times more likely to have a computer

The Survey of Household Spending collects data about the presence of selected household equipment, such as appliances and home entertainment and communication equipment. Households in the highest income quintile tend to have a higher possession rate for these items.

Top quintile households were four times more likely to have a computer or a cell phone than those in the lowest quintile, and five times more likely to have access to the Internet from home.

Virtually all of the top quintile households reported having a telephone compared to 92% for the lowest quintile households. For those households without a telephone, the primary reason given was that it was too expensive. Some households, however, elected to have a cell phone instead of a telephone.

Figure 2.6

Percentage of Households with Selected Home Entertainment, Communication and Computer Equipment by Selected Income Quintile, Canada, 2000

The presence of colour televisions was even more universal than telephones, with 97% of households in the lowest quintile reporting the presence of a television. Ownership of compact disc players was twice as likely to be reported by households in the top quintile as by those in the bottom quintile. Top quintile households were more than four times as likely to have a dishwasher as households in the lowest quintile, and nearly twice as likely to report ownership of a washing machine, clothes dryer, or freezer.

Figure 2.7

Percentage of Households with Selected Home Appliances by Selected Income Quintile, Canada, 2000

Lowest quintile more likely to have a window air conditioner

Although possession rates for most types of equipment are higher for households with the highest incomes, exceptions do occur — mostly with appliances for which a better replacement exists. Such is the case for window air conditioners. Twelve percent of households in the lowest quintile reported having one, compared to 10% for households in the top quintile. Households in the top quintile were nearly five times more likely to invest in central air conditioning than in window air conditioners.

Figure 2.8
Percentage of Households with Air Conditioners by Income Quintile, Canada, 2000

The percentage of households having only one colour television also decreased as income rose. In this case, the better replacement seemed to be more televisions, with 80% of households in the top quintile reporting the presence of two or more colour televisions, compared to 29% in the bottom quintile.

Figure 2.9
Percentage of Households with Colour Televisions by Income Quintile, Canada, 2000

Type of dwelling also plays a role in equipment ownership

In addition to income level, type of dwelling also plays a role in determining which appliances and equipment are present in the dwelling. For example, apartment dwellers are less likely to report ownership of appliances such as washers and dryers, since these appliances are often available in their buildings. Fifty-seven percent of households in the bottom quintile lived in apartments, compared to only 11% of top quintile households.

For other appliances such as freezers and dishwashers, space constraints may also be a factor. Dwellings for lowest quintile households average three fewer rooms than dwellings of households in the highest quintile.

Vehicle ownership linked to household income

Households in the top quintile are nearly twice as likely to own a vehicle as are households in the lowest quintile (93% vs. 47%). They are also more likely to own more than one vehicle. At the end of 1999, 63% of households in the top quintile had two or more vehicles, compared to only 6% of households in the lowest quintile. Spending on operating costs for vehicles also varied for each quintile. For households reporting operating costs, expenditures ranged from \$2,088 (lowest quintile) to \$6,289 (highest quintile).

Figure 2.10
Percentage of Households with Vehicles and Operational Costs by Income Quintile, Canada, 2000

Regional Patterns

Household spending levels vary across the country. Ontario households reported the highest average expenditure at \$62,738. Newfoundland households spent the least, with an average expenditure of \$43,236. Only Ontario and Alberta reported average expenditures higher than the national average.

Figure 3.1
Average Household Expenditure by Province and Canada, 2000

Taken all together, spending on the four largest categories, food, shelter, transportation and personal taxes, accounted for a similar share of household budgets in each province, ranging from a low of 62% in Saskatchewan to a high of 66% in Quebec.

Figure 3.2

Percentage of Household Budget spent on Four Largest Spending Categories by Province, 2000

In Newfoundland, households devoted the highest proportion of their budgets to food (13%) but the lowest proportion to shelter (16%). Households in British Columbia allocated the largest share of their budgets to shelter at 21%.

The percentage of the household budget devoted to transportation ranged from 13.5% in British Columbia and Ontario to almost 16% in Prince Edward Island.

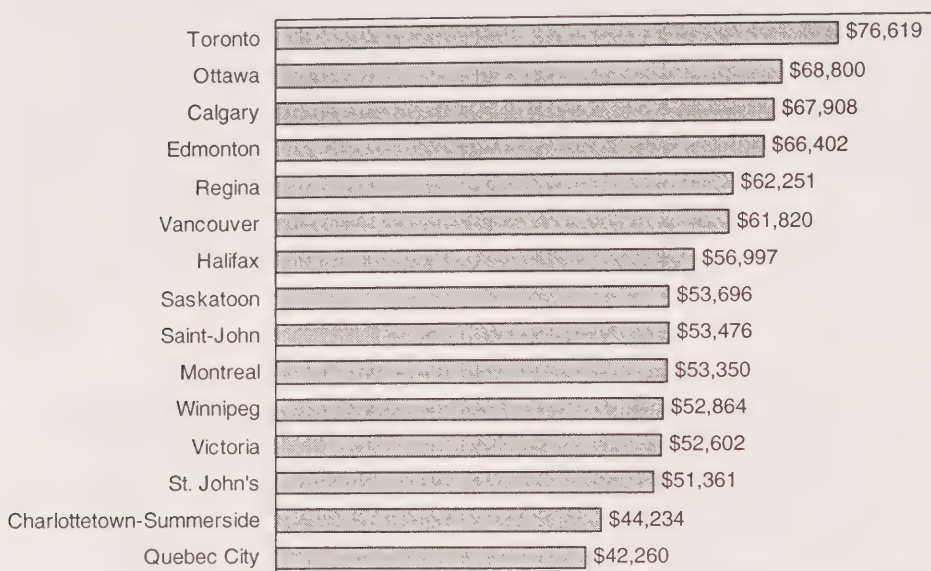

Personal taxes accounted for the highest share of the budget in Quebec at 23%, and the lowest in Prince Edward Island at 17%.

Data were not collected in the northern territories for 2000.

Toronto households have the highest expenditures

Among the 15 metropolitan areas for which data are available separately, Toronto reported the highest average spending, followed by Ottawa, then Calgary. Quebec City was the lowest spending metropolitan area.

Figure 3.3
Average Household Expenditure for Selected Metropolitan Areas, 2000

Focus on Quebec

At \$48,318, average total expenditure for Quebec households in 2000 was below the national average of \$55,834. (Only two provinces, Ontario and Alberta, exceeded the national average in 2000.) Quebec expenditures increased by almost 10% between 1998 and 2000, keeping pace with a similar increase at the national level.

Quebec food spending similar to national average except for restaurants

Average expenditure on food for Quebec households (\$6,073) was similar to the national average of \$6,217. While the amount spent by Quebecers on food from stores also closely matched the Canadian average of \$4,895, Quebec households spent almost 9% less than the Canadian average on food from restaurants (\$1,187).

Shelter spending less than national average

Quebec households spent an average of \$8,533 on shelter, 19% less than the national average. While average expenditures on rented living quarters in Quebec were similar to those in the rest of Canada, expenditures on owned living quarters were lower - \$4,239 compared to \$5,815 nationally. Almost all expenditures associated with home ownership were lower in Quebec. In particular, average regular mortgage payments were 33% lower in Quebec at \$2,265. Quebec households also reported lower expenditures on property taxes and maintenance and repairs.

Quebecers are more likely to rent than own their homes. Forty-four per cent of Quebecers rented their homes in 2000, compared to 36% for Canada as a whole.

Expenditures by both owners and renters on water and sewage and on fuels such as oil and gas were also lower for Quebec households. By contrast, electricity payments were higher.

Figure 3.4

Average Expenditure per Household Reporting on Water, Fuel and Electricity, Quebec and Canada, 2000

Transportation spending lower in Quebec

In 2000, spending on transportation by Quebec households was 16% lower than the Canadian average, due mainly to lower spending on private transportation which averaged \$5,786 per household. Quebec households that reported vehicle purchases spent less than the national average - \$9,836 compared to \$12,163. Quebecers with expenditures for the operation of a vehicle also spent less, \$3,842 compared to \$4,187. Those reporting payments on vehicle insurance premiums spent \$732 on average compared to \$1,145 nationally.

As in the rest of Canada, payments for personal taxes accounted for 22% percent of budget

As in the rest of Canada (with the exception of Prince Edward Island), the largest expenditure category for Quebec households in 2000 was personal taxes. This category accounted for just over 20% of the budget in Quebec and nationally. However, households in Quebec spent 7% less on taxes (\$11,131) than the national average, reflecting their lower average incomes.

Education and health expenditures

Average household spending on education in Quebec was around 41% lower than the Canadian average due mainly to lower spending on post-secondary tuition fees. Approximately the same percentage of households reported this expenditure in Quebec as in Canada as a whole (16%). For these households, the average expenditure was \$1,362 in Quebec compared to an overall average of \$2,907 for Canadian households.

At an average of \$1,359, average household spending on health care in Quebec mirrored the national average.

Figure 3.5

Average Household Expenditure and Budget Share for Summary Level Expenditure Categories, Quebec and Canada, 2000

	Quebec		Canada

Total expenditure	48,318	100.0	55,834	100.0

Lower Internet access in Quebec

Households in Quebec were less likely to own a computer or have access to the Internet from home. Computer ownership was reported by 45% of Quebec households compared to an average of 55% nationally. Internet use at home was reported by 33% of Quebec households compared to 42% nationally.

Although Quebec households were as likely to report having regular telephone service as the rest of Canada, average spending on this service was 19% lower in Quebec (\$563) than in Canadian households. As of December 2000, 30% of Quebec households reported owning a cell phone compared to 42% nationally.

Spending Patterns, Dwelling Characteristics, and Household Equipment for Selected Household Types

The spending patterns of Canadian households are varied. Daily decisions about what to buy and how much to spend are dependent upon household type as well as on income level, the size of the household, and the ages of the household members.¹

Figure 4.1

Average Household Spending by Type of Household, Canada, 2000

Note: a "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

b "Husband-wife households" includes households with and without children.

c "Other households" includes households composed entirely of relatives (e.g., married sons and daughters) and households having at least one unrelated person.

¹ Refer to the Notes and Definitions section for definitions of the different types of households mentioned in this report.

Husband-wife households with children spent almost twice as much as lone-parent households

Husband-wife households with children spent on average \$75,076 in 2000 compared to \$41,771 for lone-parent households. Eighty-three per cent of two-parent households had at least one full-time earner compared to only 45% of lone-parent households. Female headed lone-parent households devoted a higher proportion of their budgets to food and shelter (37%) than either two-parent households (29%) or male headed lone-parent households (29%).

While the budget share devoted to transportation by lone-parent households was only slightly less than that of two-parent households, the actual amounts spent were quite different. Two-parent households spent \$9,625 (14% of their budgets) on transportation, compared with \$5,313 for lone-parent households (13% of their budgets). Two-parent households were more likely to own a vehicle than lone-parent households. At the end of 2000, 92% of husband-wife households with children owned a vehicle, compared to 68% of lone-parent households.

Figure 4.2

Budget Share of Top Four Spending Categories, Households with Children, Canada, 2000

Note: ^a "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

Male and female lone-parent households have different spending patterns

Male lone-parent households account for 16% of all lone-parent households. Spending on all forms of transportation for male lone-parent households averaged \$8,067 – closer to that of two-parent households – compared to \$4,758 for female lone-parent households. Male lone-parent households spent more than female lone-parent

households on private transportation (buying and operating a vehicle). For those households reporting this expenditure, male lone-parent households spent an average of \$7,496 compared to \$4,173 for female lone-parent households. Eighty-five percent of male lone-parent households reported owning a vehicle, compared to 65% of female lone-parent households.

Differences in household type were also reflected in spending on recreation. Two-parent households spent nearly twice as much (\$4,489) as lone-parent households (\$2,567) on this category. Recreation spending was lower for female lone-parent households (\$2,304) than for male lone-parent households (\$3,872).

Contributing to differences in spending pattern are differences in income level and employment. Sixty-two percent of male lone-parent households had a full-time earner in 2000, compared to 47% of female lone-parent households. In addition, male lone-parent households reported a total income 33% higher than female lone-parent households.

Two-parent households twice as likely to have Internet access from home as lone-parent households

By the end of 2000, 63% of two-parent households with children had Internet access from home, compared to only 40% of lone-parent households. Male-headed lone parent households were more likely to have Internet access from home (55%) than female-headed lone-parent households (37%).

Between 1999 and 2000, Internet access from the home increased by 43% for lone-parent households compared to an increase of only 26% for two-parent households. Internet access increased by almost as much for female lone-parent households (42%) as for male lone-parent households (45%).

While female lone-parent households were more likely to have cablevision than their male counterparts, more male lone-parent households had cell phones. A 33% difference in the before-tax incomes of the two types of lone-parent households may help to explain these differences.

Figure 4.3
Percentage of Households with Children Having Selected Entertainment and Communications Equipment, Canada, 2000

Senior households² generally spend less...

In 2000, senior husband-wife households spent on average \$43,364, compared to \$56,151 for all husband-wife households (without children). Seniors living alone also reported lower spending than one-person households in general – \$20,152 compared to \$30,310.

Figure 4.4
Average Household Spending for Senior Households, Canada, 2000

Note: a "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

Spending on shelter, which was generally lower for senior households, reflected the fact that senior households were more likely to own their dwellings mortgage-free³. At the end of 2000, 79% of senior husband-wife households and 48% of seniors living alone owned their homes without a mortgage. In comparison, only 31% of all Canadian households had a mortgage-free home.

³ Canadian households that owned their homes mortgage-free spent the least on shelter, \$6,667, on average, compared to \$7,698 for households renting, and \$16,601 for households that owned their homes with mortgages.

Figure 4.5
Housing Tenure for Selected Household Types, Canada, 2000

Fewer senior households reported spending on education than other types of Canadian households and when they did, they spent less. Eleven percent of senior husband-wife households spent \$1,136 on average, and 4% of seniors living alone spent \$276, compared to 43% of Canadian households that reported spending an average of \$1,946 on education-related categories.

Seniors spent more on gifts of money

Senior husband-wife households spent almost twice the national average on gifts of money and contributions to charity – \$2,512 on average (or 6% of their household budgets) compared to \$1,302 (or 2% of the average household budget). While non-senior households were more likely to pay support payments, senior households were more likely to contribute to charity and to give gifts of money.

Senior men living alone spent more than senior women

Senior men living alone spent \$23,404 compared to \$18,930 for their female counterparts, reflecting the difference between their average incomes.

Senior men spent nearly twice as much on transportation as senior women – \$3,114 compared with \$1,636. While senior men were more likely to own vehicles than their female counterparts (71% vs. 44%), senior women, like female lone-parent households, relied more on public transportation, with 68% reporting this type of spending, compared to 47% for senior men.

Senior women spent more than senior men on categories such as personal care, clothing, and household furnishings, whereas senior men spent more on tobacco products and alcoholic beverages.

Figure 4.6

Average Spending for Seniors Living Alone, Canada, 2000

	Male	Female
	\$	
Food	3,229	2,842
Shelter	6,159	5,668

Gifts of money and contributions	1,617	1,183
Total expenditure	23,404	18,930

Shelter represents the biggest expense for people of all ages living alone

Shelter took the largest share of the budget for one-person households, 23% compared to the national average of 19%. Actual spending was \$7,101, on average, for one-person households, compared to \$10,498 for all households. Close to 86% of one-person households rented or lived in mortgage-free homes, compared to 67% for all Canadian households. Shelter costs associated with renting or mortgage-free ownership are generally much less than the costs associated with owning a home with a mortgage.

Personal taxes accounted for the second largest share of the budget of one-person households, claiming just over 19%, compared to the Canadian average of 22%.

Spending on food followed with a budget share of 11%, close to the national average. Average spending on food was \$3,764 for men and \$2,976 for women. Spending on restaurant meals was higher for males in general and for individuals working full-time. In fact men living alone and working full-time devoted 40% of their food budget to restaurants, almost twice the Canadian average of 21%.

¹ Based on full-year households only. (See "The Survey Universe" under "Notes and Definitions").

² Based on full-year and part-year households. (See "The Survey Universe" under "Notes and Definitions").

³ Quintiles are created by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same. In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household which falls on the threshold between two quintiles represents a number of households, some of which would be allocated to one quintile and some to the other. (For this reason, the upper threshold for one quintile is repeated as the lower threshold for the next quintile.) Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four.

Table 3
One-person Households, Canada (10 Provinces), 2000
Household Characteristics¹

	One-person households	Male				Female

¹ Based on full-year households only. (See "The Survey Universe" under "Notes and Definitions".)

² Based on full-year and part-year households. (See "The Survey Universe" under "Notes and Definitions".)

³ Lone-parent households consist of a parent and one or more single, never-married children of any age.

⁴ "Related persons" includes children who are no longer single, never-married and other relatives by birth or marriage.

⁵ Unrelated persons are household members who are not related to the reference person (e.g., lodgers and room-mates).

5230	Non-religious charitable organizations	174	56.4	308	0.3
Selected items in asset money flows					
5500	Registered retirement savings plans	1,476	42.5	3,474	
	Investments in the home:				
5550	Additions, renovations and alterations: contract, labour and material cost	1,026	22.0	4,659	
5555	New installations of equipment and fixtures: contract, labour and material cost	98	5.5	1,779	

¹ Based on full-year households only. (See "The Survey Universe" under "Notes and Definitions".)

² Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

³ Values are presented here as a negative expenditure.

⁴ "Average expenditure per household reporting" was calculated using unrounded data. Note also that expenditures in this column do not add to sub-totals.

Notes and Definitions

Survey Methodology

The Survey Universe

The 2000 Survey of Household Spending was carried out in private households in Canada's ten provinces. Data for the northern territories were not collected in 2000. In order to reduce response burden for northern households, it is planned to conduct the SHS only every second year, starting in 2001.

The following groups were excluded from the survey:

- those living on Indian reserves and crown lands;
- official representatives of foreign countries living in Canada and their families;
- members of religious and other communal colonies;
- members of the Canadian Armed Forces living in Military Camps;
- people living in residences for senior citizens;
- people living full time in institutions: for example, inmates of penal institutions and chronic care patients living in hospitals and nursing homes.

The survey covers about 98% of the population in the ten provinces.

Information was not gathered from persons temporarily living away from their families (for example, students at university), because it would be gathered from their families if selected. In this way, double counting of such individuals was avoided.

Data from part-year households were excluded from estimates of average household spending. However, these data were included in the estimates for dwelling characteristics and household equipment and in the calculation of the Survey of Household Spending response rate. Data from part-year households are also required as input into Canada's system of National Accounts. Part-year households are comprised entirely of persons who were members of other households for part of the reference year. There were 481 part-year households in the sample in 2000.

Survey Content and Reference Period

Detailed information was collected about expenditures for consumer goods and services, changes in assets, mortgages and other loans, and annual income. This information was collected for the calendar year 2000 (the survey reference year). Information was also collected about dwelling characteristics (e.g., type and age of heating equipment) and household equipment (e.g., appliances, communications equipment, and vehicles). This type of information was collected as of December 31st of the reference year.

Because the Survey of Household Spending is designed principally to provide detailed information on non-food expenditures, only an overall estimate of food expenditure is recorded. Detailed information on food expenditure is provided by the Food Expenditure Survey, which is conducted every four to five years. It was last conducted in 1996 and the results were published in *Family Food Expenditure in Canada, 1996*, catalogue number 62-554-XPB. It is being conducted again for the reference year 2001.

The Sample

The sample size for the 2000 Survey of Household Spending was 20,989 eligible households.

This sample was a stratified, multi-stage sample selected from the Labour Force Survey (LFS) sampling frame. Sample selection comprised two main steps: the selection of clusters (small geographic areas) from the LFS frame and the selection of dwellings within these selected clusters. The LFS sampling frame mainly uses 1991 Census geography and 1991 population counts.¹

Data Collection

The 2000 Survey of Household Spending was conducted from January to March 2001. Data were collected during a personal interview using a paper questionnaire. A copy of this questionnaire is available on request.

Only a few questions required coding and this was done by the interviewer, checked by the senior interviewer, and, in many cases, checked for consistency with the rest of the information on the questionnaire by an automated batch edit system.

Data Processing and Quality Control

Data entry and automated editing for the 2000 Survey of Household Spending took place in the Statistics Canada regional offices. This allowed respondents to be contacted in the event that more information was required to resolve an inconsistency on their questionnaires.

After data entry, an automated physical edit system checked for data entry errors. Data had to pass a two-tier edit system consisting of "must-pass" edits that checked questionnaires for logic and consistency, and "warnings" that indicated that a particular situation was unusual and could require correction. The invocation of either type of edit resulted in the intervention of a member of one of the specially trained edit resolution teams. Further editing of the data took place in head office where invalid responses were corrected.

Missing responses were imputed using the nearest neighbour method. Statistics Canada's Generalized Edit and Imputation System (GEIS) was used to insert values from donor records having similar characteristics, chosen specifically to fit the variable. For example, total household income was used for most variables; dwelling type, household size and province were also frequently used.

Tabulation for the 2000 Survey of Household Spending was accomplished using a PC/client server-based system. This system provides tools (database querying, searching, and viewing capabilities) for spotting systematic errors.

¹ A detailed description of the Labour Force Survey sampling frame can be found in Methodology of the Canadian Labour Force Survey, Statistics Canada, catalogue no. 71-526-XPB.

Weighting

The estimation of population characteristics from a sample survey is based on the premise that each sampled unit represents a certain number of units in the population. A basic survey weight was attached to each record in the sample to reflect this representation. These basic weights were adjusted for non-response for each of 17 selected metropolitan areas and 43 additional geographical areas and for 6 high-income strata. The 43 additional geographical areas comprise the remaining metropolitan areas and urban and rural areas based on census definitions but do not necessarily correspond exactly. For definitions of these terms, refer to *the 1996 Census Dictionary*, catalogue number 92-351-XPE.

To increase the reliability of the estimates, weights were adjusted to ensure that estimates based on relevant characteristics of the population would respect population totals from sources other than the survey. For the ten provinces, there are two sets of totals. The first set of totals, for age/sex groups, household size and household type at the province level, are based on projections at January 1, 2001 using the 1996 Census of Population (adjusted for net undercoverage). Controls for 18 age/sex groups are used. These are combined with totals for one-person households, two-person households and more than two-person households. There are also totals for the number of single-parent families and couples with never-married children. Finally, for the 17 selected metropolitan areas, only two age groups were used: number of persons under 18, and number of persons 18 and over.

The second set of totals are derived from T4 information from Canada Customs and Revenue Agency (CCRA, formerly Revenue Canada) and is intended to ensure that the weighted distribution of income (based on wages and salaries) in the data set matches that of the Canadian population.

The switch from 1991 to 1996 Census-based population totals and the use of T4 information from CCRA were introduced starting with the 1999 SHS. Revised SHS estimates for earlier survey years are available and should be used for year-over-year comparisons.

Data Quality

Sampling Error

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The sample design, the variability of the data, and the sample size determine the size of the sampling error. In addition, for a given sample design, different methods of estimation will result in different sampling errors.

The design for the 2000 Survey of Household Spending was a stratified multi-stage sampling scheme. The sampling errors for multi-stage sampling are usually higher than for a simple random sample of the same size. However, the operational advantages outweigh this disadvantage, and the fact that the sample is also stratified improves the precision of estimates.

Data variability is the difference between members of the population with respect to spending on a specific item or the presence of a specific dwelling characteristic or piece of household equipment. In general, the greater these differences are, the larger the sampling error will be. In addition, the larger the sample size, the smaller the sampling error.

Standard Error and Coefficient of Variation

A common measure of sampling error is the standard error (SE). Standard error is the degree of variation in the estimates as a result of selecting one particular sample rather than another of the same size and design. It has been shown that the "true" value of the characteristic of interest lies within a range of ± 1 standard error of the estimate for 68% of all samples, and ± 2 standard errors for 95% of all samples.

The coefficient of variation (CV) is the standard error expressed as a percentage of the estimate. It is used to indicate the degree of uncertainty associated with an estimate. For example, if the estimate of the number of households having a given dwelling characteristic is 10,000 households, and the corresponding CV is 5%, then the "true" value is between 9,500 and 10,500 households, 68% of the time and between 9,000 and 11,000 households, 95% of the time.

Standard errors for the 2000 Survey of Household Spending were estimated using the jackknife technique, which leads to a slight over-estimation and is, thus, conservative. For more information, refer to the Statistics Canada publication, *Methodology of the Canadian Labour Force Survey*, catalogue no. 71-526XPB.

Coefficients of variation are available in the User Guide for the Survey of Household Spending, 2000. This is available free of charge by special request (call Client Services, Income Statistics Division, 1-888-297-7355) and also at the Statistics Canada web site (www.statcan.ca). On the "Our products and services" page, choose "Research papers (free)"; then "Personal finance and household finance"; then "Household expenditure research papers series". (Catalogue number is 62F0026MIE).

Data Suppression

For reliability reasons, estimates with CVs greater than 33% should be suppressed. Since CVs are not calculated for all estimates, data suppression for the Survey of Household Spending has been based on a relationship between the CV and the number of households reporting expenditure on an item. Analysis of past survey results indicates that CVs usually reach this level when the number of households reporting an item drops to about 30. Therefore, data have been suppressed for spending on items reported by fewer than 30 households.

However, data for suppressed items do contribute to summary level variables. For example, the expenditure for a particular category of clothing might be suppressed but this amount forms part of the total expenditure estimate for clothing.

Non-Sampling Error

Non-sampling errors occur because certain factors make it difficult to obtain accurate responses or responses that retain their accuracy throughout processing. Unlike sampling error, non-sampling error is not readily quantified. Four sources of non-sampling error can be identified: coverage error, response error, non-response error, and processing error.

Coverage Error

Coverage error results from inadequate representation of the intended population. This error may occur during sample design or selection, or during data collection and processing.

Response Error

Response error may be due to many factors, including faulty design of the questionnaire, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. In the Survey of Household Spending, the difference between receipts and disbursements is calculated as a check on respondents' recall. This important quality control tool involves the balancing of receipts (income and other money received by the household) and disbursements (total expenditure plus the variable *Money flows - assets, loans, and other debts*) for each questionnaire. If the difference is greater than 10% of the larger of receipts or disbursements, respondents are contacted again for additional information. This ensures that expenditures, at least at the aggregate level, are commensurate with household income and other sources of funds.

Several features of the survey help respondents recall their expenditures as accurately as possible. First, the survey period is the calendar year because it is probably more clearly defined in people's minds than any other period of similar length. Secondly, expenditure on food (about 11% of the average budget in 2000) can be estimated as either weekly or monthly expenses depending on the respondent's purchasing habits. Thirdly, expenses on smaller items purchased at regular intervals are usually estimated on the basis of amount and frequency of purchase. Purchases of large items (automobiles, for example) are recalled fairly easily, as are expenditures on rent, property taxes, and monthly payments on mortgages. However, even with these items, the accuracy of data depends on the respondent's ability to remember and willingness to consult records.

Non-Response Error

Non-response error occurs in sample surveys because not all potential respondents cooperate fully. The extent of non-response varies from partial non-response to total non-response.

Total non-response occurs when the interviewer is unable to contact the respondent, no member of the household is able to provide information, or the respondent refuses to participate in the survey. Total non-response is handled by adjusting the basic survey weight for responding households to compensate for non-responding households. For the 2000 Survey of Household Spending, the overall response rate was 70.2%. See Figure 1 for provincial response rates.

In most cases, partial non-response occurs when the respondent does not understand or misinterprets a question, refuses to answer a question, or is unable to recall the requested information. Imputing missing values compensates for this partial non-response.

The importance of the non-response error is unknown but in general this error is significant when a group of people with particular characteristics in common refuse to cooperate and where those characteristics are important determinants of survey results.

Processing Error

Processing errors may occur in any of the data processing stages, for example, during data entry, editing, weighting, and tabulation. See Data Processing and Quality Control (above) for a description of the steps taken to reduce processing error.

Figure 1

Response Rate, Canada, Provinces, 2000

	Eligible households ¹	Non- contacts	Refusals	Un- usables ²	Usables	Response rate ³
						%
Newfoundland and Labrador	1,722	151	210	34	1,327	77.1
Prince Edward Island	790	34	84	4	668	84.6
Nova Scotia	2,040	189	375	135	1,341	65.7
New Brunswick	1,817	104	331	68	1,314	72.3
Quebec	2,595	161	510	28	1,896	73.1
Ontario	3,178	320	769	172	1,917	60.3
Manitoba	1,932	85	279	61	1,507	78.0
Saskatchewan	1,823	138	294	63	1,328	72.8
Alberta	2,310	158	519	58	1,575	68.2
British Columbia	2,782	235	514	175	1,858	66.8
Canada	20,989	1,575	3,885	798	14,731	70.2

¹ Part-year households are included in the calculation of response rates. There were 481 part year households in 2000.

² Rejected at the editing stage.

³ Usable/eligible x 100.

The Effect of Large Values

For any sample, estimates can be affected by the presence or absence of extreme values from the population. These extreme values are most likely to arise from positively skewed populations. The nature of the subject matter of the SHS lends itself to such extreme values. Estimates of totals, averages and standard errors may be greatly influenced by the presence or absence of these extremes.

Comparability Over Time

Conducted since 1997, the Survey of Household Spending integrates most of the content found in the Family Expenditure Survey and the Household Facilities and Equipment Survey. Many data from these two surveys are comparable to the Survey of Household Spending data. However, some differences related to the methodology, to data quality and to definitions must be considered before comparing these data.

For more information, refer to *Note to Former Users of Data from the Family Expenditure Survey* cat. no. 62F0026MIE2000002 and *Note to Former Users of Data from the Household Facilities and Equipment Survey* cat. no. 62F0026MIE2000003. Both documents are available free of charge on the Statistics Canada web site (www.statcan.ca).

Historical data from the 1997 and 1998 surveys of household spending, the 1996 Family Expenditure Survey and the Household Facilities and Equipment Survey have been or will be re-weighted using the new weighting methodology described above under "Weighting". **Historical comparisons with data from the 1999 and 2000 Surveys of Household Spending should generally be made with re-weighted data**, although the differences between survey estimates from the old and new methodologies appear to be minimal at a summary level. Certain populations or variables, however, may be more strongly affected.

A document describing the effect of re-weighting will be available shortly, free on the Statistic Canada web site under "Our products and services", "Research papers (free)", "Personal finance and household finance".

Definitions

General Concepts

1. The 2000 Survey of Household Spending has two reference periods and therefore two survey universes. Expenditure data are collected for the calendar year 2000. Dwelling characteristics and data about household equipment are collected as of December 31st, 2000.
2. Expenditure data are tabulated for full-year households only. Dwelling characteristics and household equipment data are tabulated for full-year and part-year households.
3. *Household*: A person or group of persons occupying one dwelling unit is defined as a "household". The number of households, therefore, equals the number of occupied dwellings. A full-year household has at least one full-year member; a part-year household is composed entirely of part-year members.
4. *Household member*: A full-year member was a member of the household for the entire year. A part-year member was a member of the household for less than fifty-two weeks. Expenditure and income information for part-year members is collected for the portion of the year during which they were members of the household or members of another household no longer in existence.
5. *Reference person*: The household member being interviewed chooses which household member should be listed as the reference person after hearing the following definition. "The household reference person is the member of the household mainly responsible for its financial maintenance (i.e., pays the rent, mortgage, property taxes, electricity). This person can be either male or female. When all members of the household share equally, any member may be shown as the reference person." This person must have been a member of the household on December 31st of the reference year.
6. *Reimbursed expenditures* are excluded from the tabulations (i.e., work-related expenses or expenditures covered by insurance).
7. *Expenses attributable to a business* are excluded from the tabulations.
8. Certain values (*Separate sale of automobiles and trucks*, *Winnings from games of chance*, and *Tax refunds*) are presented in the data tables as "negative expenditures" since they represent a flow of money into the household instead of out of it.
9. With some minor exceptions, the survey includes spending on all goods and services *received* in 2000 whether paid for before or after 2000 (such as on an installment plan).
10. All expenditures include the Goods and Services Tax, provincial retail sales taxes, tips, customs duties and any other additional charges or taxes.
11. Any expenditure may include gifts given to persons outside the household. Only the value of gifts of clothing is reported separately, as well as being included in the summary clothing category. See also the definition of "Gifts of money and contributions" below.
12. Where an insurance settlement was used to repair or replace property, the survey includes only the deductible amount paid for an item.

13. Where a trade-in is used to lower the price of an item, most commonly a vehicle, the expenditure amount is the total cost after the trade-in. Real estate transactions are excepted.

Household Characteristics

(presented in the same order as they appear on the data tables)

Number of households in sample: This refers to the number of households used for data estimation, which includes the number of households sampled, minus vacant dwellings, ineligible households, households that interviewers were unable to contact, households that refused to be interviewed, and households whose questionnaires did not pass editing procedures. For expenditure data tables, only full-year households are included. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included. See *Household* under "General Concepts".

Estimated number of households: is the estimated (weighted) number of private households on December 31st of the reference year. For expenditure data tables, the estimate is based on full-year households only. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included in the estimate. See *Household* under "General Concepts".

Average household size: is the average number of people in a household. In this context, household size is defined as the number of year-equivalent persons. The number of year-equivalent persons is calculated by dividing the number of weeks that members were part of the household by fifty-two. In this way, part-year members are counted as fractions of a year-equivalent person.

Average household income before tax: This variable includes total household income received in calendar year 2000, including gross income from wages and salaries, net income from self-employment, receipts from military pay and allowances, gross receipts from roomers and boarders not related to the reference person, net rentals, interest and dividends, all pensions, workers' compensation and employment insurance benefits, social assistance and income supplements, Child Tax Benefits, Goods and Services Tax Credits, provincial tax credits, and miscellaneous regular income receipts.

Other money receipts: refers to other receipts not included in income such as cash gifts, inheritance, or life insurance settlements. Winnings from games of chance are also included if they exceed the amount spent on games of chance.

Money flows - assets, loans and other debts: includes net changes during the reference year (calendar year 2000) in bank balances; money on hand; money owed to the household; money owed by the household; purchase and sale of stocks and bonds, personal property, and real estate; expenditures on home additions, renovations and new installations; and contributions to and withdrawals from registered retirement savings plans.

The Family Expenditure Survey, last conducted in 1996, had a similar variable called *Average net change in assets and liabilities*. For a complete description of the differences between the two variables, see *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Percentage homeowners (December 31st, 2000): is the percentage of households living in a dwelling owned (with or without a mortgage) by a member of the household at December 31st of the reference year.

Average age of reference person: This variable acts as a general age indicator for the household and uses the reference person's age in years as of December 31st. Prior to 1996, in the Family Expenditure Survey, the age of the husband was used for married-couple households and the age of the reference person for all other households. See *Reference person* under "General Concepts".

Selected Household Expenditures

(presented in the same order as they appear on the data tables)

Total expenditure: includes *Total current consumption*, *Personal taxes*, *Personal insurance payments and pension contributions*, and *Gifts of money and contributions*.

Caution should be used when comparing total expenditure to total expenditure from 1996 and earlier. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Total current consumption: shows the expenses incurred during the reference year for food, shelter, household operations, household furnishings and equipment, clothing, transportation, health care, personal care, recreation, reading materials, education, tobacco products and alcoholic beverages, games of chance, and a miscellaneous group of items.

Caution should be used when comparing total current consumption to total current consumption from 1996 and earlier. Prior to 1997, expenditures for gifts were not included in total current consumption. Starting in 1997, these expenditures are reported in the appropriate spending category and, therefore contribute to total current consumption. See also "Shelter" and "Miscellaneous".

Food purchased from stores: "Stores" includes frozen food provisioners, outdoor farmers' markets and stands, and all other non-service establishments.

Food purchased from restaurants: "Restaurants" includes refreshment stands, snack bars, vending machines, mobile canteens, caterers and coffee wagons.

Shelter: includes expenditures on principal accommodation (either owned or rented) and on other accommodation such as vacation homes or accommodation while travelling.

Expenditure on owned principal accommodation includes regular mortgage payments, if any. This definition of shelter differs from that of the Family Expenditure Survey last conducted in 1996. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Rent: refers to the net household expense for rent after adjusting for rebates and for any use of the dwelling for business. No adjustment for partial subletting to non-household members is made. Receipts from this activity are considered part of household income.

Tenants' insurance/Homeowners' insurance: are the premiums paid in 2000 for fire and comprehensive policies. Premiums covering more than the reference year were not prorated.

Maintenance, repairs and replacements (owned living quarters): covers expenditures for work contracted out, labour cost, and materials purchased separately for all types of maintenance, repairs and replacements. This variable includes expenditures on built-in appliances and other equipment and fixture replacements. Money spent on additions, renovations and new installations is considered to contribute to an increase in assets and is included in *Money flows - assets, loans and other debts*.

An annual data series showing household expenditures on repairs and renovations is available from the Homeowner Repair and Renovation Survey. See *Homeowner Repair and Renovation Expenditure*, catalogue no. 62-201.

Property taxes and sewage charges: refer to the amount billed, excluding any rebates. Special service charges (e.g., garbage, sewage), local improvements, and water charges are included if these are part of the property tax bill. Property taxes that are included in condominium charges are excluded.

Traveller accommodation: excludes accommodation that was part of a travel tour (which is included in *Package travel tours*).

Household appliances: refers to the net purchase price after deducting trade-in allowance and any discount. This variable excludes appliances included in the purchase of a home and built-in appliances. Expenditures on household fixtures (i.e., built-in appliances and wall-to-wall carpeting) can be reported under the appropriate expenditure item or, if they were part of a larger job, under *Additions, renovations and alterations*, or *Maintenance, repairs and replacements*.

Purchase of automobiles and trucks: refers to the net purchase price, including extra equipment, accessories, and warranties bought when the vehicle was purchased, after deducting any trade-in allowance or separate sales. (Separate sales occur when a vehicle is sold independently by the owner, i.e., not traded-in when purchasing or leasing another vehicle.)

Health care: includes direct (out-of-pocket) costs and expenditures on insurance premiums. The distinction between premiums for private health insurance plans and publicly funded (provincial) plans is not always clear to respondents. Interviewers are trained to assist, but the variations in coverage and administration among the various provincial health care regimes makes this a difficult task. For this reason, more confidence can be placed in the overall estimate for *Health insurance premiums* than in the components: *Public hospital, medical and drug plans* and *Private health insurance plans*.

Package travel tours: includes at least two components such as transportation and accommodation, or accommodation with food and beverages.

Tobacco and smokers' supplies: includes cigarettes, tobacco, cigars, matches, pipes, lighters, ashtrays, cigarette papers and tubes, etc. Purchases of tobacco products and smokers' supplies are frequently under-reported.

Alcoholic beverages: includes those purchased from stores and restaurants. Also included are expenditures on supplies and fees for self-made beer, wine or liquor. Purchases of alcoholic beverages are frequently under-reported.

Games of chance (net): equals the sum of expenditures on all types of games of chance minus the sum of winnings from all types of games of chance. If total winnings are greater than total expenditures, the amount to be subtracted from expenditures is set to \$1 less than the expenditures and the value of the remaining winnings is moved to the variable *Other money receipts*. Expenditures on games of chance are frequently under-reported.

Miscellaneous expenditures: includes expenses on other owned property (not principal accommodation or vacation home), legal services not related to dwellings, financial services, dues to unions and professional associations, contributions and dues for social clubs and other organizations, forfeits of deposits, fines, money lost or stolen, the purchase of tools and equipment for work, and other miscellaneous goods and services.

Caution should be used when comparing current data for *Miscellaneous expenditures* to data from the Family Expenditure Survey (1996 or earlier). For a complete description of the differences between the two variables, see Note to former users of data from the Family Expenditure Survey (62F0026MIE2000002) available free on the Statistics Canada website.

Personal taxes: are income taxes paid in 2000 on 2000 and previous years' incomes plus other personal taxes (e.g., gift taxes, Newfoundland school tax) minus income tax refunds received in 2000. Tax credits, such as Federal Child Tax Benefits, Goods and Services Tax Credits and provincial tax credits, are included in *Average household income before taxes*.

Personal insurance payments and pension contributions: includes payments for life insurance, annuities, employment insurance, public and private pension plans, and similar items. For certain uses of the data, some of these items might be regarded as savings, although the relationship between the expenditure and any increase in savings may not be easily determined. This category of expenditure was called *Security* prior to the 1996 survey. (Registered retirement savings plan (RRSP) contributions are included in *Money flows - assets, loans and other debts*.)

Gifts of money and contributions: includes money and support payments given to persons outside the household or to charity. This does not include money spent on gifts to persons outside the household, as was the case in the Family Expenditure Survey.

Alimony: This variable is available starting in 1998. Before 1998, expenditures on alimony were included under *Gifts of money and other support payments to persons living inside Canada* or *Gifts of money and other support payments to persons living outside Canada*.

Dwelling Characteristics

Dwelling characteristics are collected as of December 31st

Type of dwelling: This variable describes the type of dwelling in which the household resided on December 31st. A dwelling is a structurally separate set of living premises with a private entrance from outside the building or from a common hall or stairway.

A single detached dwelling contains only one dwelling unit and is completely separated by open space on all sides from any other structure, except its own garage or shed.

A single attached dwelling is a double or semi-detached unit (side-by-side) or a row or terrace unit.

The classification *apartment* includes duplexes (two dwellings, situated one above the other), triplexes, quadruplexes or apartment buildings.

Other dwellings include mobile homes, motor homes, tents, railroad cars or houseboats, which are used as permanent residences and are capable of being moved on short notice.

Repairs needed: This variable indicates the respondent's perception of the repairs the dwelling needed on December 31st to restore it to its original condition. Remodelling, additions, conversions, or energy improvements that would upgrade the dwelling over and above its original condition are not included.

Major repairs include serious deficiencies in the structural condition of the dwelling, as well as the plumbing, electrical and heating systems. Examples include corroded pipes, damaged electrical wiring, sagging floors, bulging walls, damp walls and ceilings, crumbling foundation.

Minor repairs include deficiencies in the surface or covering materials of the dwelling and less serious deficiencies in the plumbing, electrical and heating systems. Examples include small cracks in interior walls and ceilings, broken light fixtures and switches, cracked or broken panes, leaking sinks, missing shingles or siding, peeling paint.

Regular maintenance includes painting, fixing leaking faucets, clogged gutters or eavestroughs, etc.

Tenure: This variable gives the housing status of the household on December 31st. Note that housing tenure may also refer to the entire reference year. See "Housing tenure" under "Classification Categories for Standard Tables".

Owned with mortgage indicates that the dwelling is owned by a household member and that there is a mortgage as of December 31st.

Owned without mortgage indicates that the dwelling is owned by a household member and that there is no mortgage as of December 31st.

Rented indicates that the dwelling is rented by the household for the entire reference year or occupied rent-free as of December 31st.

Year of move: This item refers to the year the household moved into the dwelling. If the dwelling was occupied by previous generations, the first year of residence for the household member who has occupied the dwelling the longest is recorded.

Period of construction (for dwelling occupied on December 31st): This variable gives the year or period in which the original building was constructed.

Number of rooms (for dwelling occupied on December 31st): This variable includes the kitchen, bedrooms, and finished rooms in the attic or basement. It excludes bathrooms, halls, vestibules and rooms used solely for business purposes.

Number of bathrooms (for dwelling occupied on December 31st): This variable indicates the number of rooms in the dwelling with an installed bathtub and/or shower.

Principal heating equipment (for dwelling occupied on December 31st): This variable indicates the type of heating equipment chiefly used to heat the dwelling in winter.

Steam or hot water furnaces distribute central heating through radiators located throughout the house and connected by pressure pipes.

Forced hot air furnaces distribute central heating by a motor-driven fan through vents located throughout the dwelling. (This is the most common central heating system.) Furnaces with a pump are included in this category.

Other hot air furnaces distribute central heating by convection (natural) flow of hot air through vents located throughout the house. Gravity furnaces are included in this category.

Heating stoves are localized heating units with no central distribution system to other parts of the house (e.g., oil space heater, gas space heater, wood stoves).

Electric heating includes permanently installed baseboard electric heating and other types such as floor or ceiling heating wires in all or most rooms.

Other heating includes cookstoves and any other type of heating equipment not listed above.

Age of principal heating equipment installed (for dwelling occupied on December 31st): indicates how long ago the principal heating equipment was installed.

Principal heating fuel (for dwelling occupied on December 31st): The principal winter fuel used in the principal heating equipment is given here (e.g., oil or other liquid fuel, piped or bottled gas, electricity, wood or other fuels).

Principal heating fuel for hot water (for dwelling occupied on December 31st): indicates the type of fuel used for the running hot water supply (e.g., oil or other liquid fuel, piped gas, electricity or other fuels such as bottled gas or wood).

Principal cooking fuel (for dwelling occupied on December 31st): indicates the main fuel for the range or stove on which the household does most of the cooking (e.g., piped gas, electricity or other cooking fuels). "Other" includes oil or other liquid fuel, bottled gas and wood.

Household Equipment (at December 31)

In general, appliances and equipment are included if they are in working order or will soon be repaired, and are located within the dwelling occupied on December 31st. They must be owned or leased for the exclusive use of the household.

Washing machine: An automatic washing machine is fully automatic with wash and rinse cycles. Washing machines located outside the dwelling and shared with other households are excluded. "Other" washing machines include electric wringer washers.

Clothes dryer: Clothes dryers located outside the dwelling and shared with other households are not included. Dryers may be electric or gas.

Dishwasher: Dishwashers may be built-in or portable.

Freezer: A freezer is an individual piece of equipment and not part of a refrigeration unit such as the freezer in a refrigerator.

Air conditioner: A central air conditioner is designed to cool the air in the entire building and may be located either inside or outside the dwelling unit, for example, in the basement of an apartment block. A window-type air conditioner is installed in a window or through a wall to cool the air in a room.

Telephone (includes business use): Telephones used for business are included if the business is conducted in the dwelling. Cordless phones are included. Cellular telephones are excluded.

Cellular telephone: Cordless phones are excluded.

Compact disc player: A compact disc player may be a separate unit, part of a component or built in (as in a receiver/cassette recorder/compact disc combination unit).

Video cassette recorder: Video cassette recorders (VCRs) are units which play videocassettes when attached to a television or monitor.

Home computer: Computers used exclusively for business purposes are not included.

Modem: A modem is a communication device for microcomputers that translates a computer's digital signal into an analogue signal (and vice versa) for transmission over telephone lines or cables. A modem may be located inside a microcomputer's system cabinet. It may also be a separate unit (external).

Internet use from home: This variable indicates whether the household accesses the Internet via a computer in the house. It includes cases where a home computer is used to link to a business computer located outside the dwelling for access to the Internet. Excluded are cases where the Internet is accessed directly through a computer located outside the dwelling (e.g., work).

Owned vehicles: This variable gives the number of vehicles (car, van/mini-van, truck/sport utility vehicle) owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned automobiles: gives the number of automobiles owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned vans or trucks: gives the number of vans, minivans, trucks and sport utility vehicle owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Classification Categories for Standard Tables

Canada: In 1998, 1999, and every second year thereafter starting with 2001, statistics for Canada include the territories. For the other years, Canada-level statistics include the ten provinces only.

Province/Territory: Refers to the major political divisions of Canada. Data for territories are available for 1997 (coverage insufficient for inclusion in Canada-level statistics), 1998, 1999 and every second year thereafter starting with 2001.

Metropolitan Areas: The overall concept for delineating metropolitan areas is one of a large urban area together with adjacent urban and rural areas that have a high degree of social and economic integration with this urban area. (See the *1996 Census Dictionary*, p. 181, catalogue no. 92-351-XPE.)

For the Survey of Household Spending, data are tabulated based on the 1996 census metropolitan area (CMA) boundaries. In the Survey of Household Spending, only data for the Ottawa, Ontario part of the Ottawa-Hull CMA, are tabulated for the metropolitan area. The data for Hull, Quebec part, are included in the data tabulated for the province of Quebec and Canada (10 provinces). Also, the municipality of Selkirk is included in the Survey of Household Spending metropolitan area of Winnipeg, whereas it is not included in the CMA of Winnipeg.

The metropolitan areas for which the data are tabulated are: St. John's, Charlottetown - Summerside, Halifax, Saint John, Quebec, Montreal, Ottawa, Toronto, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver and Victoria.

Income: Readers requiring official income statistics are directed to the publication *Income in Canada*, catalogue number 75-202.² In the SHS, income quintiles are used as classifiers in the data tables. In addition, *Average household income before tax* is a descriptive household characteristic found at the beginning of each expenditure table (see definition above under "Household Characteristics").

Household income quintiles: Income quintiles are income groupings obtained by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same.

In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household, which falls on the threshold between two quintiles, represents a number of households, some of which would be allocated to the lower quintile and some to the higher. Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four.

Custom tabulations of other income quintiles and various income groups are available subject to data quality restrictions. Contact Client Services at 1-888-297-7355.

Housing tenure: refers to whether a household member owned or rented the dwelling(s) in which the household lived during the reference year (calendar year 2000). See also "Tenure" under "Dwelling Characteristics".

All owners refers to households living for the entire reference year in a dwelling owned (with or without mortgage) by a household member. See also "Percentage homeowners (December 31st)" under "Household Characteristics".

Owners without mortgage owned the dwelling for the entire reference year and had no mortgage on December 31st.

Owners with mortgage owned the dwelling for the entire reference year and had a mortgage on December 31st.

Renters rented a dwelling for the entire reference year (as a regular tenant, rent free, or with reduced rent).

Mixed tenure includes those households that both owned and rented during the reference year.

Household type: Households are divided into the following types:

Husband-wife households are households where the married or common-law spouse of the reference person was a member of the household on December 31st, 2000. This household type may be further broken down into husband-wife households without children (without additional persons), with children (without additional persons), and with additional persons. "Children" are never-married sons, daughters, or foster children

² Traditionally, the Survey of Consumer Finances (SCF) has been the source of Statistics Canada's annual income estimates. Starting with data for the 1998 reference year, the Survey of Labour and Income Dynamics (SLID) produces annual cross-sectional income estimates.

of the reference person and may be any age. "Additional persons" include sons, daughters and foster children whose marital status is other than "single, never married", other relatives by birth or marriage, and unrelated persons.

Lone-parent households are households where no spouse of the reference person is present and there is at least one child (never-married son, daughter, or foster child of the reference person). The lone-parent households for which data are presented in this publication do not include any additional persons.

Other households may be broken down into households composed of relatives only and households having at least one unrelated person. Relatives may include:

- sons, daughters and foster children of the reference person whose marital status is other than "single, never married";
- relatives of the reference person by birth or marriage (not spouse, son, daughter, or foster child);
- spouse of the reference person who was not present in the household on December 31st, 2000.

Size of area of residence: Sampled dwellings are assigned to the following groups depending on the 1996 population size (according to the 1996 census boundaries) of the metropolitan area, municipality, or area in which they are located.

Urban

- 1,000,000 and over
- 500,000 – 999,999
- 250,000 – 499,999
- 100,000 – 249,999
- 30,000 - 99,999
- under 30,000

Rural

Urban area: For the Survey of Household Spending (based on the LFS sampling frame), urban areas include:

- all larger metropolitan areas (even though they do contain some rural areas);
- most smaller metropolitan areas (also called census agglomerations). In some cases, where a census agglomeration contains a large rural population, only the urban portion is considered urban;
- urban areas based on the census definition: Urban areas have minimum population concentrations of 1,000 and a population density of at least 400 per square kilometre, based on the previous census population counts.

Rural area: All territory outside urban areas is considered rural. Taken together, urban and rural areas cover all of Canada.

The Relationship between Expenditure Estimates from the SHS and the System of National Accounts

Users should note some important differences between estimates of total current consumption from the Survey of Household Spending (SHS) and personal expenditure on consumer goods and services from the System of National Accounts (SNA). Data from the SHS are an important, but by no means the only, source of data used by the SNA in the compilation of their accounts.

Current expenditure estimates for both the SHS and the SNA cover all personal outlays on goods and services by Canadian residents at home and abroad. In addition, personal expenditure on consumer goods and services from the SNA includes the operating expenditure of "associations of individuals", which include private non-profit organizations such as charitable institutions, labour unions, private pension funds, mutual funds, mutual insurance companies and similar non-commercial groups. These organizations are regarded as groups of persons acting collectively for the benefit of the community.

Estimates from the National Accounts include expenditures made in the northern territories. SHS estimates include data for the north only for years when the survey is conducted there. So far, the SHS has included northern data in its Canada totals for 1998 and 1999. It is planned to conduct the survey in the north again for 2001 and every second year thereafter.

Data about the expenditures of persons living alone who died, emigrated, or were institutionalized during the survey year are excluded from the SHS but are included in the National Accounts. Unlike the SHS, the National Accounts include data for Canadian residents based overseas, such as diplomats and military personnel.

The SHS presents information about the purchase of both new and used goods. In the National Accounts, personal expenditure includes spending on new goods, but for used goods, only the dealer mark-up is included.

Several expenditures that are not directly incurred by household members are assigned imputed values in the National Accounts. For example, National Accounts assigns imputed values for the following: the cost of farm products consumed directly in farm households and the cost of items received by employees in lieu of wages.

An imputation is also made for household expenditure on the financial intermediation services of banks and other financial institutions for which no explicit charges are recorded, i.e., the portion of bank interest charges that represent administration costs.

In the SHS, shelter expenditures for homeowners include items such as property taxes, homeowner's insurance, regular mortgage payments, utilities, and spending on maintenance and repairs. In the National Accounts, personal spending on shelter for homeowners is determined by imputing a rental value for their dwellings.

Total current consumption in the SHS and total personal expenditure in the National Accounts cover mainly the same categories of goods and services. However, total current consumption includes some items that are excluded from total personal expenditure in the National Accounts such as: public medical insurance premiums and the transfer portion of interest on consumer debt.

The SHS, because it is a survey, is able to provide detailed expenditure data not only at the national and provincial/territorial level, but also for various metropolitan areas, income groups, and types of households. The SNA provides data at the national and provincial/territorial level only. This is because the necessary data integration and imputation based on multiple data sources can only be performed at the aggregate level.

Related Products and Services

Detailed Tables

The information in this publication represents only a summary of the results available from the 2000 Survey of Household Spending. The following standard tables are also available:

62F0031	Detailed Average Household Expenditure for Canada, Provinces and Selected Metropolitan Areas
62F0032	Detailed Average Household Expenditure by Household Income Quintile for Canada and Provinces
62F0033	Detailed Average Household Expenditure by Housing Tenure for Canada
62F0034	Detailed Average Household Expenditure by Household Type for Canada
62F0035	Detailed Average Household Expenditure by Size of Area of Residence for Canada
62F0041	Dwelling Characteristics and Household Equipment for Canada, Provinces and Selected Metropolitan Areas
62F0042	Dwelling Characteristics and Household Equipment by Income Quintile for Canada
62F0043	Dwelling Characteristics and Household Equipment by Housing Tenure for Canada
62F0044	Dwelling Characteristics and Household Equipment by Household Type for Canada
62F0045	Dwelling Characteristics and Household Equipment by Size of Area of Residence for Canada

Custom Tabulations

Custom tabulations can be produced to your specifications on a contract basis (subject to confidentiality restrictions). Aggregate data at the detailed expenditure level (including both full-year and part-year households) are also available on a custom basis.

Public-use Microdata File

A public-use microdata file based on the 2000 survey is available. It contains household spending data, as well as data on household characteristics, dwelling characteristics, household facilities and equipment, and income for over 14,000 records. All records have been thoroughly screened to ensure the anonymity of respondents.

Public-use microdata files presenting spending data from previous family expenditure surveys are available for the following years: 1969, 1978, 1982, 1984, 1986, 1990, 1992 and 1996. Public-use microdata files presenting spending data from the 1997, 1998 and 1999 surveys of household spending are also available. As well, public-use microdata files presenting dwelling characteristics and household facilities and equipment data from previous household facilities and equipment surveys are available for every survey year since 1982 except 1983.

Household Expenditures Research Papers Series

This series provides detailed documentation on issues, concepts, methodology, data quality and other relevant research related to household expenditures from the Survey of Household Spending, the Homeowner Repair and Renovation Survey, and the Food Expenditure Survey.

Examples of these research papers include the: user guides for the Survey of Household Spending, 1992-2000; data quality indicators for the Survey of Household Spending, 1998-2000; and the Methodology of the Survey of Household Spending.

These research papers are available in English and French, at no charge, on the Internet.

On the "Our products and services" page, choose "Research papers (free)"; then "Personal finance and household finance"; then "Household expenditure research papers series". The user guide can also be obtained by calling Client Services, Income Statistics Division, 1-888-297-7355.

CANSIM

CANSIM (the Canadian Socio-Economic Information Management System) is a database consisting of multi-dimensional cross-sectional tables.

Income Statistics Division is pleased to announce the introduction of Table 203-0001: *Household spending, summary-level categories by province and territory, annual*. This table presents annual information from the Survey of Household Spending about the spending habits of Canadian households. It covers the survey years from 1997 to 2000.

Client Services

For clients with more specialized data needs, custom tabulations can be produced on a cost-recovery basis. For more information or to enquire about the concepts, methods, data quality or the product line, contact Client Services (1 888 297-7355 or 613 951-7355; income@statcan.ca), Income Statistics Division.

canada year book 2001

READING, DISCOVERY AND EXPLORATION

a terrific combination!

Canada Year Book 2001 is a meticulously detailed, invitingly readable reference that is nothing less than a stunning depiction of today's Canada, packed with information about the nation, its people, its economy and its environment.

Explore Canada— one page at a time!

Canada Year Book 2001 is a fact-filled and entertaining collection of data, stories and essays plus a gallery of intriguing photographs. Flip through the pages of this impressive book and you will feel as though Canada is at your fingertips.

Need timely, accurate information about Canada?

Canada Year Book 2001 should be your first choice. From settling a friendly argument to completing a research report, the potential uses of this book are vast. It's the essential reference for parents, executives, teachers, librarians, writers, researchers,

journalists, students, visitors to Canada PLUS public administrators, special interest groups, associations, and more.

Income Trends in Canada

In these times of rapid change, it is more crucial than ever before to understand income trends of Canadians

With *Income Trends in Canada*, tracking and understanding developments in Canadian incomes is easy!

Use this CD-ROM to view trends with one mouse click. Create your own tables. Chart income data. And more!

Get the overall picture with nearly two decades of data for Canada, the provinces and 15 metropolitan areas

For \$195, you will find everything you need to know about income trends going back to 1980, through two recessions and recovery periods! Get accurate and reliable statistics about:

- ▶ income from employment... and other sources
- ▶ taxes
- ▶ impact of government transfers on family income
- ▶ differences in earnings between women and men
- ▶ income of Canada's seniors
- ▶ income inequality and low income
- ▶ and a lot more!

Need more details? Check out *Income Trends in Canada* on our Web site at <http://www.statcan.ca/english/ads/72-202-XIE/index.htm> or contact your nearest Statistics Canada Regional Reference Centre at 1 800 263-1136.

Order *Income Trends in Canada* TODAY

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Note

Due to reliability concerns, the average expenditure and percentage not reporting zero have been replaced by "F" in the tables for items reported by fewer than 30 households. This suppression criterion should not restrict valid use of the data since these items would normally have coefficients of variation of 30% or more. This symbol should not be interpreted as zero. The expenditure items are components of more reliable higher aggregates.

Highlights

Highlights of Household Spending, Dwelling Characteristics and Household Equipment in 2001

Canadian households in the ten provinces spent an average of \$57,480 in 2001 on everything from food, shelter and clothing to recreation and travel, according to estimates from the 2001 Survey of Household Spending. This amount was a 3.4% increase from the average of \$55,610 in 2000, slightly higher than the rate of inflation of 2.6% as measured by the Consumer Price Index (CPI). Unless otherwise indicated, all expenditure values quoted in this release are in current dollars.

The proportion of the household budget allocated to the four largest spending categories remained largely unchanged. Personal taxes claimed an estimated 21% of the household budget, while shelter followed at 19%. Transportation and food accounted for 13% and 11% respectively.

Spending on shelter up in 2001

In 2001, households spent an estimated average of \$10,740 on shelter during the year, up 4.5% from \$10,280 the year before. The increase in spending on shelter was driven mainly by spending on owned accommodation, especially utilities, repairs and property taxes. Average spending for reporting households on the three main utilities—water, fuel and electricity—went from an estimated \$1,920 in 2000 to \$2,040 in 2001, an increase of 6.1%.

Average spending on water and sewage charges was \$490 for those households that reported such expenditures, up 7.6% from the year before. Spending on fuels such as oil and natural gas rose an average of 7.4% to \$1,070. In 2001, the price of natural gas rose 30% over 2000, according to the CPI.

Approximately four in ten homeowners reported spending on maintenance, repairs and equipment replacement in 2001. On average, reporting households allocated \$1,490 in 2001 compared with \$1,190 in 2000 on these expenditures. Payments on property taxes for those households reporting them were up 3.3% to \$1,940.

Spending on food higher than in previous years

Households spent an average \$6,430 on food in 2001, up 3.5% from \$6,220 in the previous year. The increase in spending on food was due mainly to higher spending on restaurant meals, which rose about 10% to \$1,430. Spending in restaurants accounted for almost one-fifth of all spending on food. On average, each household spent about \$4,970 on food purchased from stores, up slightly from 2000.

Transportation spending remained stable

Households spent an average of \$7,600 on transportation in 2001. This amount was virtually unchanged from 2000. However, spending on gasoline and other fuels for vehicles declined 5.9% in 2001 to an average of \$1,840 for households reporting this purchase. This drop was more than double the decline in gas prices, which fell 2.6% in 2001, according to the CPI.

Spending on communication services continued to rise

In 2001, 60% of households reported owning a computer, compared with 55% in 2000 and 50% in 1999. About one-half of all households reported using the Internet from home in 2001, up from 42% in 2000 and 33% in 1999.

New data from the 2001 Survey of Household Spending showed that 57% of households that reported using the Internet from home used a regular telephone connection to a computer to access the Internet. About 17% had a high speed telephone connection and an estimated 24% were connected to the Internet by cable. The remaining 2% of households used other types of connections.

Households with a regular telephone connection as of December 31st spent an average of \$240 in 2001 on Internet services. This compares with \$410 for those with a high speed telephone connection and \$440 for those connected by cable.

About 48% of households reported having a cellular telephone in 2001, up from 42% the year before. Average spending on cellular services for those households reporting remained stable at \$475.

Spending on televisions, VCRs, camcorders and other television/video components such as home theatres increased from an average of \$680 in 2000 to \$720 in 2001 for those households reporting.

Spending on education increasing

Average household spending on education went up in 2001. Around 45% of households reported spending an average of \$2,010 on education, an increase of 3.4% from 2000. This was largely the result of increased spending on kindergarten, nursery school, elementary and secondary education. Households reporting these expenditures allocated 23% more towards tuition fees, and spent 7.2% more on supplies, compared with the previous year. Spending on post-secondary education held steady.

Household expenditures on health care higher in 2001

Average household spending on health care in Canada increased 4.7% in 2001 to an estimated \$1,420 per household. This was due in part to increased spending on health insurance premiums which rose an estimated 13% between 2000 and 2001. For the 54% of households that reported such expenditures in 2001, average payments were estimated at \$880. Health insurance premiums cover payments for publicly sponsored health/drug insurance plans where applicable and private health insurance plans, including dental coverage and accident/disability insurance.

Food, shelter costs accounted for half the spending in lowest-income households

In 2001, the one-fifth of households with the lowest incomes spent almost 50% of their budget on food and shelter, and only 3.2% on personal taxes. In contrast, the one-fifth of households with the highest incomes allocated 23% of their budgets to food and shelter, while 30% went to personal taxes. These proportions for both groups were virtually unchanged from 2000.

The one-fifth of households with the lowest incomes had average annual spending of \$18,050 in 2001, compared with \$116,770 for the one-fifth of households with the highest incomes.

After adjusting for differences in household size, average spending was \$14,880 for the one-fifth of households with the lowest incomes, only one-quarter the level of \$60,470 for households with the highest incomes.

Households with the lowest incomes spent an estimated \$3,270 on food in 2001, about one-third the level of \$9,950 spent by those with the highest incomes. Similarly, spending on shelter amounted to about \$5,660 for the households with the lowest incomes, and \$17,240 for those with the highest.

Average spending highest in Ontario, Alberta

Only two provinces reported average levels of household spending above the national average of \$57,500 in 2001: Alberta at \$65,520 and Ontario at \$64,100. The Yukon and the Northwest Territories were also above the national average. Newfoundland and Labrador continued to have the lowest provincial average, \$46,450.

Nationally, food and shelter together accounted for 30% of the household budget. Households in most provinces and territories hovered around this mark, except for those in Nunavut which devoted an average of just over 37% of their budgets to food and shelter.

In Nunavut, food spending took an average of 23% of the household budget, double the national level of 11%, while shelter took 15% compared with 19% nationally. Higher food spending was mainly due to the higher cost of food, but also to larger households in Nunavut.

Couple households with children more likely to have Internet access from home than lone-parent households

By the end of 2001, 72% of couple households with children had Internet access from home, compared with only 48% of lone-parent households. However, Internet access from home is increasing more quickly for lone-parent households. Between 2000 and 2001, Internet access from home increased 19% for lone-parent households compared with 15% for couples with children.

Seniors spend more on gifts of money

Senior couple households reported spending nearly twice the national average on gifts of money and contributions to charity: \$2,430 on average (or 5.9% of their household budget) compared with \$1,260 (or 2.2% of the average household budget). While non-senior households were more likely to pay support payments, senior households were more likely to contribute to charity and to give gifts of money.

Introduction

This report presents the results of the 2001 Survey of Household Spending,¹ conducted January through March 2002. Information about the spending habits, dwelling characteristics and household equipment of Canadian households was obtained by asking people across Canada to recall their expenditures for the previous calendar year and their dwelling characteristics and household equipment at the end of 2001.

The 2001 survey was conducted in all ten provinces and the northern territories. In 1998, 1999 and 2001, statistics for Canada include the territories. For the other years, Canada-level statistics include the ten provinces only. Unless otherwise indicated, all expenditure values quoted in this release are in current dollars.

The mortgage payment calculation has been revised for all years beginning in 1997. This has resulted in downward revisions in the following expenditure categories: "Regular mortgage payments", "Owned living quarters", "Principal accommodation", "Shelter", "Total current consumption", and "Total expenditure".

This report is organized into the following sections:

- Four analytical articles covering recent trends; the effect of income on spending patterns; regional variations (with a focus on Alberta); and spending patterns, dwelling characteristics and household equipment for different types of households.
- Graphs for each summary level expenditure category by province/territory and metropolitan area.
- Data tables presenting information for provinces/territories, metropolitan areas, income quintiles, housing tenure and various types of households. These tables present information at the summary level but are also available on a cost recovery basis at the detailed level (see Table 8) upon request.
- Survey notes and definitions. A more detailed User Guide (Catalogue no. 62F0026MIE) is available free of charge by visiting the Statistics Canada web site (www.statcan.ca). See Related Products and Services for information about obtaining this guide.

We welcome your comments, questions, and suggestions for future articles. Please contact Client Services at: income@statcan.ca or 1-888-297-7355.

¹ Starting with the 1997 reference year, the Survey of Household Spending replaced the Family Expenditure Survey and the Household Facilities and Equipment Survey. See Note to former users of data from the Family Expenditure Survey and Note to former users of data from the Household Facilities and Equipment Survey (Catalogue no. 62F0026MIE) for more information.

Recent Trends¹

Average household spending in Canada rose 3.4% between 2000 and 2001, from \$55,614 to \$57,482. This increase exceeded the annual inflation rate of 2.6% for 2001 as measured by the Consumer Price Index (CPI), and was slightly less than the increase in average household income (4.2%).

The proportion of the household budget allocated to the four largest spending categories remained largely unchanged. Personal taxes claimed an estimated 21% of the household budget, while shelter followed at 19%. Transportation and food took 13% and 11% respectively.

Graph 1.1

Budget Share of Top Four Spending Categories, Canada (10 Provinces), 1997-2001

% of budget

Note: Canada-level statistics include the ten provinces only.

Spending on shelter up in 2001

Households spent an estimated \$10,737 on shelter in 2001, up 4.5% from the previous year. The increase in spending on shelter was driven mainly by an increase in spending on owned accommodation, especially utilities, maintenance and repairs, and property taxes.

Average spending on the three main utilities—water, fuel and electricity—increased 6.1% in 2001, rising from an estimated \$1,922 in 2000 to \$2,039 in 2001 for households reporting such expenditures. Average spending by reporting households on water and sewage charges was \$493 in 2001, up 7.6% from the

¹ All expenditure values quoted in this chapter are in current dollars. In this chapter, all comparisons between 2001 and 2000 are based on averages for the ten provinces only (excluding the territories). Therefore data for 2001 shown in this chapter will differ from the totals shown in the main tables.

Note: Canada-level statistics include the ten provinces only.

previous year. Similarly, spending on fuels such as oil and natural gas rose an average of 7.4% to \$1,072. In 2001, the price of natural gas rose 30% over 2000, according to the CPI.

Approximately four in ten homeowners reported spending on maintenance, repairs and equipment replacement in 2001. On average, reporting households allocated \$1,489 in 2001 compared with \$1,189 in 2000 on these expenditures. Payments on property taxes for those households reporting them were up 3.3% to \$1,940.

Spending on food also higher

In 2001, households spent an estimated \$6,432 on food, up 3.5% from the year before. The increase in spending on food was due mainly to higher spending on restaurant meals, which rose by about 10% to \$1,432. Spending in restaurants² accounted for almost one-fifth of all household spending on food. On average, each household spent \$4,973 on food purchased from stores, up slightly from 2000.

Households spending less on gasoline

Households spent an average of \$7,596 on transportation in 2001. This amount was virtually unchanged from 2000. However, spending on gasoline and other fuels for vehicles declined 5.9% in 2001, to an average of \$1,837 for households reporting this purchase. This drop was more than double the decline in gas prices, which fell 2.6% in 2001, according to the CPI.

Spending on education increasing

Average household spending on education went up in 2001. Around 45% of households reported spending an average of \$2,012 on education, an increase of 3.4% from 2000. This was largely the result of increased spending on kindergarten, nursery school, elementary and secondary education. Households reporting these expenditures allocated 23% more towards tuition fees, and spent 7.2% more on

² Includes drive-ins, canteens, cafeterias and take-outs.

supplies compared with the previous year. Spending on post-secondary education held steady.

Household expenditures on health care on the rise

Average household spending on health care in Canada increased 4.7% in 2001, to an estimated \$1,421 per household. This was due in part to increased spending on health insurance premiums which rose an estimated 13% between 2000 and 2001. For the 54% of households that reported such expenditures in 2001, average payments were estimated at \$882. Health insurance premiums cover payments for publicly sponsored health/drug insurance plans where applicable and private health insurance plans, including dental coverage and accident/disability insurance.

Note: Canada-level statistics include the ten provinces only.

Computers and the Internet increasingly important to Canadians

Home computer use has grown in leaps and bounds in recent years, showing annual increases of around five percentage points per year between 1997 and 2001. By the end of 2001, 60% of Canadian households reported having a home computer. This compares with 55% in 2000, 50% in 1999, and only 10% in 1986, the first year data were collected.

Home access to the Internet has grown even more rapidly. About one-half of all households reported using the Internet from home in 2001, up from 42% in 2000, 33% in 1999 and only 7.4% in 1996, the first year this information was collected. Households with expenditures on Internet services spent an average of \$317 in 2001, up from \$280 in 2000.

New data from the Survey of Household Spending showed that in 2001, about 50% of households reported using the Internet from home. Of those households, 57% used a regular telephone connection to a computer to access the Internet. About 17% of reporting households had a high-speed telephone connection and an estimated 24% were connected to the Internet by cable. The remaining 2% of households used other types of connections.

Households with a regular telephone connection as of December 31st spent an average of \$242 in 2001 on Internet services. This compares with \$407 for those with a high-speed telephone connection and \$440 for those connected by cable.

Graph 1.2
Percentage of Households with Computer and Internet Access, Canada
(10 Provinces), 1986-2001

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey. Data for December 1997 on are from the Survey of Household Spending. Canada-level statistics include the ten provinces only.

The percentage of households reporting expenditures on computer hardware continued to increase over previous years. In 2001, 22% of households reported spending on computer hardware, up two percentage points from 2000. This compares with 17% of households in 1999 and only 2.9% in 1986. Average household spending for 2001 was \$1,256, down 14% from 2000, continuing the downward trend in spending observed since 1996. Prices for computer equipment and supplies as measured by the Consumer Price Index fell 66% between 1996 and 2001.

Graph 1.3
Percentage of Households Reporting Spending on Computer Hardware, Canada
(10 Provinces), 1986-2001

Note: Canada-level statistics include the ten provinces only.

Cell phones becoming more common

Cellular telephone use has shown steady annual increases since 1996, the first year for which these data were collected. By the end of 2001, 48% of households

reported having a cell phone, up from 42% the year before. Average household spending on cell phone services for those households reporting amounted to \$475 in 2001, similar to 2000.

Graph 1.4

Percentage of Households with Cell Phones, Canada (10 Provinces), 1996-2001

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey. Data for December 1997 on are from the Survey of Household Spending. Canada-level statistics include the ten provinces only.

Long-term trends in possession of home entertainment equipment...

Over the past two decades, Canadian households have adopted a wide variety of home entertainment equipment. Colour televisions continue to hold universal appeal: over 99% of households had at least one colour TV set in 2001. The percentage of households with cablevision declined slightly in 2001, with 68% of households reporting such spending, compared with 72% in 2000.

At the end of 2001, the percentage of households with video recorders and CD players was approximately 92% and 71% respectively.

New data collected in 2001 showed that as of December 31st, 18% of households reported having a satellite dish. Around 20% of households reported having a DVD player, and 19% had a CD writer.

Graph 1.5

Percentage of Households with Selected Home Entertainment Equipment, Canada (10 Provinces), 1983-2001

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey. Data for December 1997 on are from the Survey of Household Spending. Canada-level statistics include the ten provinces only.

...and of home appliances

Since 1981 the proportion of households reporting most home appliances has shown steady but slow growth. The exception is the microwave oven, which has been adopted more rapidly and more extensively than costlier or less portable items such as air conditioners, dishwashers or freezers.

Graph 1.6
Percentage of Households with Selected Home Appliances, Canada
(10 Provinces), 1981-2001

Note: Data up to and including May 1997 are from the Household Facilities and Equipment Survey. Data for December 1997 on are from the Survey of Household Spending. Canada-level statistics include the ten provinces only.

The Effect of Income Level

Household spending patterns are strongly influenced by income level. In 2001, households in the lowest income quintile¹ spent an average of \$18,052 while households in the highest quintile spent \$116,769. Households in the lowest quintile spent around half of their budgets on food and shelter (\$8,929). In contrast, households in the highest quintile spent \$27,196 on these two necessities, representing slightly less than one-quarter of their budgets. Households in the top income quintile devoted 30% of their budgets to personal taxes, compared with only 3.2% for households in the bottom quintile. For both groups, these proportions were virtually unchanged from previous years.

While there was a large difference between the lowest and the highest quintiles in spending on transportation (\$1,909 for the lowest quintile compared with \$14,871 for the highest quintile), the budget share devoted to transportation was similar at all income levels.

Graph 2.1
Percentage of Household Budget Spent on Top Four Spending Categories, by Income Quintile, Canada, 2001

Adjusting spending data for household size yields a more realistic picture

Household spending patterns vary not only by income but also by household size. On average, lower income households are smaller than households with higher incomes. Households in the lowest income quintile averaged 1.5 persons, compared with 3.4 persons for households in the highest quintile. Furthermore, 63% of households in the bottom income quintile were composed of people living alone, compared with only 4.5% for those in the top quintile.

¹ An income quintile is a grouping based on income level obtained by ranking households in ascending order according to total household income and partitioning them into five groups such that the estimated number of households in each group is the same.

Table 2.1
Average Household Expenditure by Income Quintile, Canada, 2001

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
	\$				
Food	3,272	4,978	6,319	7,666	9,954
Shelter	5,657	7,594	10,198	13,001	17,242
Transportation	1,909	4,689	6,952	9,557	14,871
Personal taxes	582	3,400	8,081	14,194	34,833
Other categories ^a	6,632	12,325	18,399	25,305	39,869
Total expenditure	18,052	32,986	49,949	69,723	116,769

^a "Other categories" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

After adjusting for household size,² the estimate for average spending by households in the highest quintile was reduced from six times to four times that of households in the lowest quintile.

Table 2.2
Average Household Expenditure Adjusted for Household Size, by Income Quintile, Canada, 2001

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
	\$				
Food	2,697	3,426	3,905	4,283	5,155

Other categories ^a	5,467	8,482	11,371	14,137	20,647
Total expenditure	14,882	22,702	30,871	38,951	60,471

^a "Other categories" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

Graph 2.2
Total Household Expenditure Unadjusted and Adjusted for Household Size, by Income Quintile, Canada, 2001

² The household size adjustment reflects the principle that family needs increase with family size. The adult equivalence scales chosen were those used for the Low Income Measures (LIM, Catalogue no. 13-582). Each additional adult is assumed to increase the family's needs by 40% of the 'needs' of the first adult, and each child's needs are assumed to be 30% of those of the first adult. One exception is for households composed of one adult and one or more children. In that case, the first child is assumed to increase the family's needs by 40%, instead of 30%. The following adult equivalent household sizes were used to adjust the unrounded expenditure data by quintile (lowest to highest quintile): 1.213, 1.453, 1.618, 1.790 and 1.931.

Using estimates adjusted for household size, spending on basic needs such as food and shelter by households in the highest income group was only twice that of households in the lowest income group. However, for categories such as personal taxes and insurance payments/pension contributions, households in the highest income group spent 38 times and 14 times more, respectively, than households in the lowest income group.

In addition to household size, there are other important characteristics that account for different spending patterns between households in the highest and lowest income quintiles. For example, 93% of households in the top quintile have one full-time earner or more, compared with only 10% for households in the bottom quintile. Only 4.1% of highest quintile households have a reference person aged 65 or older, compared with 42% for households in the lowest quintile. Furthermore, 87% of households in the top quintile are couple households, compared with only 20% of households in the bottom quintile.

Graph 2.3

Expenditure Ratio Adjusted for Household Size, Highest to Lowest Income Quintile, Canada, 2001

Spending ratio (highest quintile divided by lowest quintile)

Highest income households more likely to have a computer

The Survey of Household Spending collects data on the presence of selected household equipment, such as home entertainment, communication equipment and household appliances. Households in the highest income quintile are more likely to report these items.

Top quintile households were three-and-a-half times more likely to have a computer or a cell phone than those in the bottom quintile, and four-and-a-half times more likely to have access to the Internet from home.

Virtually all households in the highest income quintile reported having a regular telephone compared with 91% of households in the lowest income quintile. For those households without a regular telephone, the primary reason given was that it was too expensive. Some households, however, elected to have a cell phone instead of a regular telephone.

Graph 2.4
Percentage of Households with Selected Home Entertainment, Communication and Computer Equipment, by Selected Income Quintile, Canada, 2001

The presence of colour televisions was even more universal than that of telephones, with 97% of households in the lowest income quintile reporting the presence of a television. However, the number of colour televisions reported rose with income, with 83% of households in the top quintile reporting the presence of two or more colour televisions, compared with 29% in the bottom quintile. Households in the top quintile were twice as likely to have a compact disc player as those in the bottom quintile.

Graph 2.5
Percentage of Households with Colour Televisions by Income Quintile, Canada, 2001

Lowest quintile more likely to have a window air conditioner

Although possession rates for most types of equipment are higher for households with the highest incomes, exceptions do occur—mostly with appliances for which a better replacement exists. Such is the case for air conditioners. For example, around 13% of households in the lowest quintile reported having a window air conditioner, compared with 7.7% of households in the top quintile. Households in the top quintile were more than five times as likely to invest in central air conditioning as in window air conditioners.

Graph 2.6

Percentage of Households with Air Conditioners by Income Quintile, Canada, 2001

Type of dwelling may play a role in equipment possession

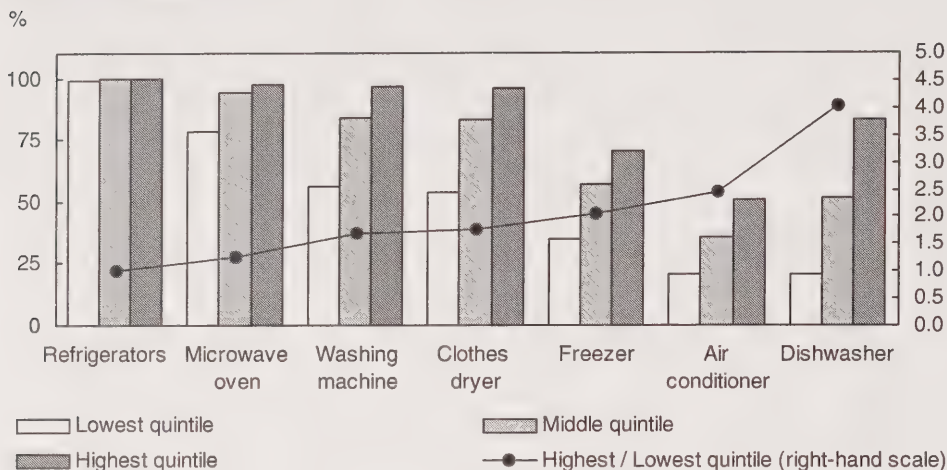

In addition to income level, type of dwelling may influence, in part, which appliances and equipment are present in the home. For example, apartment dwellers are less likely to report having appliances such as washers and dryers, since these appliances are often available in their buildings. Around 56% of households in the lowest quintile lived in apartments, compared with only 10% of households in the highest income quintile. Households in the highest income group were twice as likely to have a washing machine or clothes dryer as households in the lowest income group.

For other appliances such as freezers and dishwashers, space constraints may also be a factor. Dwellings for lowest quintile households average three fewer rooms than dwellings of households in the highest quintile. Households in the highest income quintile were twice as likely to have a freezer, and four times as likely to have a dishwasher compared with households in the lowest quintile.

Decision to own/lease a vehicle linked to household income

Households in the top income quintile are over twice as likely to own or lease a vehicle as are households in the bottom quintile (98% vs. 47%). They are also more likely to own more than one vehicle. At the end of 2001, around 64% of households in the highest income quintile owned two or more vehicles, compared with only 6.6% of households in the lowest quintile. Spending on operating costs for vehicles also varies across quintiles. For households reporting operating costs, average expenditures ranged from \$2,002 (lowest quintile) to \$6,134 (highest quintile).

Graph 2.7
Percentage of Households with Selected Home Appliances by Selected Income Quintile, Canada, 2001

Graph 2.8
Percentage of Households with Vehicles and Operational Costs, by Income Quintile, Canada, 2001

Regional Patterns

In 2001, households in the Northwest Territories reported the highest spending of all provinces and territories, spending an average of \$67,993. Among the provinces, Alberta reported the highest average household expenditure at \$65,516, while households in Newfoundland and Labrador reported the lowest, with average spending totalling \$46,448.

Graph 3.1
Average Household Expenditure by Province/Territory and Canada, 2001

Taken together, spending on the four largest categories—food, shelter, transportation and personal taxes—accounted for a similar share of the total household budget in each of the provinces and territories, ranging from a low of 60% in Nunavut to a high of 65% in Ontario.

The percentage of the household budget spent on food was relatively stable throughout most of Canada, comprising approximately 11% of the household budget. The exception was Nunavut, where food spending accounted for 23% of the average household budget. Households in Nunavut reported spending an estimated average of \$11,944, twice the national average of \$6,438.

However, compared with the rest of Canada, households in Nunavut allocated a smaller proportion of their total budget to shelter in 2001. While other Canadian households devoted around 19% of their total spending to shelter, households in Nunavut spent about 15%.

Graph 3.2
Percentage of Household Budget Spent on Top Four Spending Categories by Province/
Territory and Canada, 2001

Nationally, transportation accounted for 13% of the household budget, compared with only 6.1% in Nunavut. However, when spending on the purchase and operation of recreational vehicles was added to the transportation category, the budget share for Nunavut increased to 12%. Certain recreational vehicles such as snowmobiles and boats are used for transportation in the north.

Personal taxes as a percentage of household spending ranged from around 17% in Nunavut and Prince Edward Island to 23% in Quebec.

Ottawa households have the highest expenditures

Among the 18 metropolitan areas for which separate data are available, Ottawa reported the highest average spending at \$82,736, followed by Yellowknife and Calgary. Charlottetown–Summerside had the lowest average spending at \$45,322.

Caution should be exercised when making year-to-year comparisons for metropolitan-level data since changes may not be statistically significant due to smaller sample size. In order to determine whether a change is statistically significant, please refer to the SHS 2001 User Guide (Catalogue no. 62F0026MIE) where information about sampling error as well as coefficients of variation and how to use them is available. Special caution is necessary when using estimates from small sub-groups (such as certain metropolitan areas) where the sample size is less than 200.

Graph 3.3

Average Household Expenditure for Selected Metropolitan Areas, 2001

Focus on Alberta

Each year, the publication highlights data on household spending patterns for a selected region, province, or territory in Canada. For 2001, the focus is on the province of Alberta.

Average total expenditure for Alberta households in 2001 was \$65,516, the highest of all ten provinces and 14% above the national average, though still below the average for the Northwest Territories. Household expenditures in Alberta increased 5.9% between 2000 and 2001, exceeding increases of 3.4% observed at the national level. Higher spending for households in Alberta reflects higher average incomes in this province compared with Canada in general.

Alberta households spent more eating in restaurants

Average expenditures on food by Alberta households totaled an estimated \$6,728 in 2001, 4.5% above the national average of \$6,438. While the amount spent by residents of Alberta on food purchased from stores was similar to average spending by other Canadian households, when it came to spending on food from restaurants, Alberta households that reported dining out spent \$1,735. This amount exceeded average restaurant spending by reporting households in all other provinces and territories.

Alberta households spent more on shelter than the national average

Alberta households spent an average of \$11,629 on shelter, 8.3% more than other Canadian households. The average expenditure on rented living quarters by reporting households in Alberta was higher than in the rest of Canada—\$6,904 compared with \$6,780. Similarly, expenditures on owned living quarters for reporting households were also higher—\$9,111 compared with \$8,860 nationally.

In Alberta, average annual spending by both owners and renters on water and sewage was higher than the Canadian average—households that reported such expenditures spent \$674 compared with \$494 nationally. By contrast, spending on electricity was lower, with average spending for reporting households totaling \$987, compared with an estimated national average of \$1,161.

Graph 3.4

Average Expenditure per Household Reporting on Water, Fuel and Electricity, Alberta and Canada, 2001

Transportation spending above national average in Alberta

In 2001, spending on transportation by Alberta households was 16% higher than the Canadian average, due mainly to higher spending on private transportation which averaged \$8,022 per household. Albertans that reported vehicle purchases spent about 7.7% more than the rest of Canada—\$13,532 per reporting household. Residents of Alberta who reported expenditures for the operation of a vehicle spent slightly more than the national average—\$4,279 per household compared with \$4,125 nationally. Finally, those reporting payments on vehicle insurance premiums spent an estimated average \$1,395, higher than average spending in the rest of Canada (\$1,206).

Personal taxes account for the largest share of the household budget in Alberta

The largest expenditure for Alberta households was personal taxes, which accounted for 21% of the household budget, about the same as the national average. However, due to higher incomes, households in Alberta reported the third highest payments for personal taxes—\$13,816 on average, after those in the Northwest Territories (\$14,251) and in Ontario (\$14,026).

Financial security for retirement important to Albertans

Around 84% of households in Alberta made payments to government and non-government retirement and pension funds, including the Canada Pension Plan, compared with 75% in the rest of Canada. For reporting households, spending totaled \$2,764 compared with \$2,590 nationally. In 2001, average payments to registered retirement savings plans for the 51% of households in Alberta that reported them were \$5,759. This amount was 40% higher than the national average household contribution of \$4,102 reported by 41% of Canadian households.

Table 3.1

Average Household Expenditure and Budget Share for Summary-level Spending Categories, Alberta and Canada, 2001

	Alberta		Canada	
	Average	Budget share	Average	Budget share
	\$	%	\$	%
Food	6,728	10.3	6,438	11.2

Total expenditure	65,516	100.0	57,496	100.0

Alberta households spent more on health care

In 2001, Alberta households allocated an estimated \$1,966 towards health care expenditures, spending 38% more than the Canadian average (\$1,420). Spending on health care supplies and medicinal/pharmaceutical products for households reporting these expenditures was almost 18% higher than the national average—\$1,161 compared with \$984. Alberta residents also spent more on health insurance premiums¹ compared with other Canadians, with average expenditures for reporting households totalling \$1,090 compared with \$882 nationally.

Percentage of households with Internet access higher in Alberta

In 2001, households in Alberta were more likely to have a home computer or have access to the Internet from home. Computer ownership was reported by 66% of Alberta households compared with a national average of 60%. Internet use at home was reported by 56% of Alberta households compared with 50% nationally.

¹ Spending on health insurance premiums includes payments for publicly sponsored health/drug insurance plans where applicable and private health insurance plans, including dental coverage and accident/disability insurance.

Of the Alberta households that reported using the Internet from home, about 46% used a regular telephone connection to a computer as their mode of internet access, compared with 57% in the rest of Canada. About 35% of Alberta households with Internet access connected to the Internet by cable, compared with 24% nationally. An estimated 17% of households had a high speed telephone connection, a percentage similar to national estimates. The remaining 2% used other types of connections.

Although Alberta households were as likely to report having regular telephone service as the rest of Canada, average spending on this service was almost 10% higher in Alberta at \$757. As of December 31st, 57% of Alberta households reported having a cell phone compared with 48% nationally.

Spending Patterns, Dwelling Characteristics, and Household Equipment for Selected Household Types

Daily decisions about what to buy and how much to spend are dependent upon household demographic factors such as household type, income level, household size, and age of household members.¹

Graph 4.1

Average Household Expenditure by Type of Household, Canada, 2001

Note: ¹ "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

² "Couple households" includes households with and without children.

³ "Other households" includes households composed entirely of relatives (e.g., married sons and daughters) and households having at least one unrelated person.

¹ Refer to the Notes and Definitions section for definitions of the different types of households discussed in this publication.

Couple households with children spent almost twice as much as lone-parent households

Couples with children spent on average \$78,995 in 2001 compared with \$43,960 spent by lone-parent households. About 15% of couple households with children had no full-time earner, while 45% of lone-parent households had no full-time earner. Lone-parent households devoted a higher proportion of their budgets to food and shelter (35%) than couples with children (28%).

While the budget share devoted to transportation by lone-parent households was only slightly less than that of couple households with children, the actual amounts spent were quite different. Couples with children spent \$10,569 (13% of their budgets) on transportation, compared with \$5,116 spent by lone-parent households (12% of their budgets). Couples with children were more likely to own or lease a vehicle than lone-parent households. At the end of 2001, 96% of couples with children owned or leased a vehicle, compared with 74% of lone-parent households.

Graph 4.2

Budget Share of Top Four Spending Categories, Households with Children, Canada, 2001

Note: ¹ "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

Couple households with children more likely to have Internet access from home than lone-parent households

By the end of 2001, 72% of couple households with children had Internet access from home, compared with only 48% of lone-parent households. However, Internet access from home is increasing more quickly for lone-parent households. Between

2000 and 2001, Internet access from home increased 19% for lone-parent households compared with 15% for couples with children.

Just over two-thirds of all households with children reported spending on cablevision in 2001. However, couples with children were more likely to purchase satellite service, with 20% reporting such spending compared with 9.4% of lone-parent households.

Nine out of ten couples with children reported buying reading materials such as newspapers, magazines and books, with average spending for reporting households totalling \$346. In contrast, fewer lone-parent households (81%) reported such spending in 2001. Lone-parent households spent less compared with couples with children, allocating \$252 towards reading materials.

Male and female headed lone-parent households have different spending patterns

In 2001, 81% of lone-parent households in Canada were headed by a female. Female lone-parent households devoted a higher proportion of their budgets to food and shelter (36%) than male headed lone-parent households (30%).

Contributing to differences in spending patterns were differences in employment and income level. Around 62% of male lone-parent households had a full-time earner in 2001, compared with 47% of female lone-parent households. Furthermore, the average before-tax income reported by male lone-parent households was 33% higher than the average before-tax income of female lone-parent households.

Male lone-parent households spent 55% more on private transportation than their female lone-parent counterparts—\$6,305 compared with \$4,073 respectively. A higher percentage of male lone-parent households reported owning or leasing a vehicle—84% compared with 72% of female lone-parent households. Higher spending on private transportation is due to costs associated with owning and operating a vehicle such as vehicle purchases, purchase of gasoline and other fuels, and repairs and maintenance.

Female lone-parent households relied more on public transportation. Average spending on buses, subway rides, taxis, and airplane travel was 47% higher for female lone-parent households than it was for male lone-parent households: \$654 compared with \$444.

Male headed lone-parent households spend more on entertainment and recreation

Average spending on recreation was lower for female lone-parent households (\$2,413) than for male lone-parent households (\$3,147). This was mainly due to differences in expenditures related to recreational vehicles.² Spending was much higher for male lone-parent households—\$376 on average compared with \$84 for their female counterparts. Male lone-parent households also spent 61% more than female lone-parent households on membership and user fees for recreation facilities for golfing, bowling, ski/snowboarding and health clubs. This expenditure averaged \$404 per male lone-parent households in 2001, while female lone-parent households spent an average of \$251.

² Recreational vehicles include purchase and operation of bicycles, travel trailers, motorcycles, snowmobiles, motor homes, and boats.

Female lone-parent households were more likely to have cablevision than their male counterparts (75% compared with 71%), while more male lone-parent households had cell phones (51% compared with 44%). Female headed and male headed lone-parent households were equally likely to have Internet access from home—48% for female headed households and 46% for their male counterparts.

Graph 4.3

Percentage of Households with Children Having Selected Entertainment and Communications Equipment, Canada, 2001

Shelter represents the biggest expense for people of all ages living alone

Shelter took the largest share of the budget for one-person households: 23% compared with the national average of 19%. On average, spending was \$7,309 for individuals living alone, compared with \$10,738 for all households. Around 86% of one-person households rented shelter or lived in mortgage-free homes, compared with 66% for all Canadian households. Shelter costs associated with renting or mortgage-free ownership are generally much less than the costs associated with owning a home with a mortgage. In 2001, 38% of one-person households were composed of seniors.

Personal taxes accounted for the second largest share of the budget of one-person households, claiming 20% of the household budget, similar to the Canadian average of 21%.

One-person households allocated 11% of their total budget to food, the same as the national average. Average spending on food was \$3,961 for men and \$3,099 for women. Spending on restaurant meals was higher for men in general and for all individuals working full-time. In fact, men with full-time jobs who lived alone devoted 39% of their food budget to restaurants, almost twice the Canadian average of 22%.

Graph 4.4
Share of Food Budget Spent at Restaurants by One-person Households, Canada, 2001

Senior households³ generally spend less

Senior households generally spend less than other types of households. In 2001, senior couple households spent on average \$41,019, compared with \$57,837 spent by all couple households (without children). Seniors living alone also reported lower spending than one-person households in general: \$21,917 compared with \$31,103.

Graph 4.5
Average Household Expenditure for Senior Households, Canada, 2001

Note: ¹ "Other expenditures" includes all remaining spending categories such as clothing, furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

³ Includes individuals living alone aged 65 years or over, and couples where both individuals are 65 years of age or over.

Spending on shelter, which was generally lower for senior households, reflected the fact that senior households were more likely to own their dwellings mortgage-free.⁴ At the end of 2001, 78% of senior couple households and 47% of seniors living alone owned their homes without a mortgage. In comparison, only 31% of all Canadian households had a mortgage-free home.

Graph 4.6
Housing Tenure for Selected Household Types, Canada, 2001

As expected, fewer senior households reported spending on education than other types of Canadian households, and when they did, they spent less. Around 10% of senior couple households reported spending an average of \$1,431 on education, largely on post-secondary tuition fees. Average expenditures of \$339 were reported by 5.5% of seniors living alone, with the largest allocation going towards tuition fees. In comparison, the 45% of Canadian households that reported expenditures on education spent an average of \$2,011 on all education-related categories.

Seniors spend more on gifts of money

Senior couple households reported spending nearly twice the national average on gifts of money and contributions to charity: \$2,426 on average (or 5.9% of their household budget) compared with \$1,259 (or 2.2% of the average household budget). While non-senior households were more likely to pay support payments, senior households were more likely to contribute to charity and to give gifts of money.

Senior men living alone spent more than senior women

Senior men living alone spent \$25,233 compared with \$20,652 spent by their female counterparts, reflecting the difference between their average incomes.

For those reporting transportation expenditures, senior men who lived alone spent twice as much as senior women living alone: \$4,073 compared with \$2,023. While senior men were more likely to own or lease a vehicle than their female counterparts (65% vs. 45%), senior women, like female lone-parent households, relied more on public transportation, with 69% reporting this type of spending, compared with 58% of senior men.

⁴ Canadian households that owned their homes mortgage-free spent the least on shelter—\$7,094 on average—compared with \$7,856 for households that rented and \$16,579 for households that owned their homes with mortgages.

Senior women spent more than senior men on categories such as personal care, clothing, and health care, whereas senior men spent more on restaurants, recreation, tobacco products and alcoholic beverages.

Table 1
Provinces and Territories, 2001
Household Characteristics¹

	Canada	Newfound- land and Labrador	Prince Edward Island	Nova Scotia	New Brunswick	Quebec	Ontario
Number of households in sample	16,385	1,407	640	1,511	1,460	1,985	2,097
Estimated number of households	11,552,010	190,580	50,580	355,160	281,780	2,953,150	4,302,710
Average household size	2.56	2.71	2.64	2.51	2.56	2.40	2.66
Average number of children aged:							
less than 5	0.13	0.12	0.12	0.11	0.12	0.11	0.14
5 to 14	0.33	0.32	0.36	0.32	0.32	0.30	0.35
Average number of youths aged:							
15 to 19	0.20	0.22	0.23	0.18	0.19	0.17	0.21
20 to 24	0.15	0.18	0.15	0.14	0.15	0.14	0.15
Average number of adults aged 25 to 64	1.44	1.57	1.44	1.42	1.45	1.37	1.48
Average number of seniors aged 65 and over	0.32	0.32	0.34	0.34	0.33	0.30	0.33
Average age of reference person	50	50	50	50	50	50	50
Average household income before tax	59,256	47,668	47,027	49,048	47,010	51,343	66,720
Average other money receipts	1,425	640	1,917	1,117	1,609	819	1,405
Average money flows - assets, loans and other debts	3,202	1,745	1,879	1,263	1,009	1,984	4,287
Percentage homeowners (December 31, 2001)	66.1	77.9	72.3	74.2	74.5	59.7	65.9
Percentage with:							
no full-time earner	40.3	57.9	45.5	47.3	46.4	44.3	36.7
one full-time earner	38.6	28.3	34.3	36.3	34.9	37.7	39.8
two or more full-time earners	21.1	13.8	20.2	16.4	18.7	18.1	23.5
Percentage with age of reference person:							
under 25	2.1	F	F	1.3	2.8	2.2	1.3
25 to 44	39.3	38.7	39.4	39.8	37.1	37.5	40.1
45 to 64	38.4	42.3	36.2	38.2	38.9	39.6	38.5
65 and over	20.2	17.6	20.8	20.8	21.2	20.7	20.2
Percentage one person households	24.7	15.7	22.8	23.0	20.6	28.0	23.6
Percentage couple households	59.6	71.2	63.5	60.8	65.0	55.7	60.5
Percentage lone-parent households	9.4	9.4	9.5	10.3	9.2	10.4	9.3

See footnotes at end of table.

Table 1
Provinces and Territories, 2001 – Continued
Household Characteristics¹

	Manitoba	Saskat- chewan	Alberta	British Columbia	Yukon	Northwest Territories	Nunavut
Number of households in sample	1,454	1,438	1,682	1,919	247	347	198
Estimated number of households	412,250	371,220	1,084,100	1,520,870	10,140	12,790	6,670
Average household size	2.54	2.51	2.66	2.54	2.50	2.87	3.69
Average number of children aged:							
less than 5	0.14	0.14	0.14	0.12	F	0.23	0.44
5 to 14	0.35	0.37	0.38	0.31	0.42	0.58	0.85
Average number of youths aged:							
15 to 19	0.21	0.21	0.22	0.19	0.20	0.21	0.39
20 to 24	0.14	0.15	0.18	0.15	F	0.13	0.34
Average number of adults aged 25 to 64	1.35	1.28	1.49	1.44	1.52	1.56	1.55
Average number of seniors aged 65 and over	0.35	0.36	0.27	0.33	0.19	0.17	F
Average age of reference person	51	51	48	50	46	45	42
Average household income before tax	52,547	49,903	68,398	57,476	66,081	72,132	53,860
Average other money receipts	1,834	1,175	2,212	2,165	2,184	1,388	1,470
Average money flows - assets, loans and other debts	2,270	2,839	5,096	2,553	4,943	5,010	2,135
Percentage homeowners (December 31, 2001)	72.8	72.8	72.7	66.0	64.7	50.6	21.3
Percentage with:							
no full-time earner	37.5	42.7	30.9	44.9	36.3	25.7	47.2
one full-time earner	40.3	36.0	44.2	35.5	44.0	47.3	39.6
two or more full-time earners	22.2	21.3	25.0	19.6	19.6	26.9	F
Percentage with age of reference person:							
under 25	2.9	3.6	3.4	2.8	F	F	F
25 to 44	38.3	36.4	43.6	38.4	47.7	52.6	57.6
45 to 64	35.1	34.7	36.5	38.8	38.8	34.9	30.3
65 and over	23.7	25.3	16.5	20.0	F	10.6	F

Leased vehicles (automobiles, trucks and vans)	9.8	1.3	4.8	9.4	13.4	20.0

¹ Based on full-year households only (see "The Survey Universe" under "Notes and Definitions").

² Based on full-year and part-year households (see "The Survey Universe" under "Notes and Definitions").

³ Quintiles are created by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same. In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household which falls on the threshold between two quintiles represents a number of households, some of which would be allocated to the quintile and some to the other. (For this reason, the upper threshold for one quintile is repeated as the lower threshold for the next quintile.) Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four.

Leased vehicles (automobiles, trucks and vans)	12.9	7.2	10.4	13.9	17.1

¹ Based on full-year households only (see "The Survey Universe" under "Notes and Definitions").

² Based on full-year and part-year households (see "The Survey Universe" under "Notes and Definitions").

³ Couple households include those headed by both married and common-law couples.

⁴ Without additional persons. See footnote 6 for definition of additional persons.

⁵ Children can be any age as long as they are single (never-married). Foster children are included.

⁶ "Additional persons" includes other relatives and unrelated persons.

⁷ Households in this category may or may not have children.

	Investments in the home:				
5550	Additions, renovations and alterations: contract, labour and material cost	1,239	20.8	5,944	
5555	New installations of equipment and fixtures: contract, labour and material cost	102	5.3	1,918	

* Variables preceded by an asterisk are included for the 2001 reference year only.

¹ Based on full-year households only (see "The Survey Universe" under "Notes and Definitions").

² Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

³ Values are presented here as a negative expenditure.

⁴ "Average expenditure per household reporting" was calculated using unrounded data. Note also that expenditures in this column do not add to sub-totals.

Notes and Definitions

Survey Methodology

The Survey Universe

The 2001 Survey of Household Spending was carried out in private households in Canada's ten provinces and three territories.¹

The following groups were excluded from the survey:

- those living on Indian reserves and crown lands;
- official representatives of foreign countries living in Canada and their families;
- members of religious and other communal colonies;
- members of the Canadian Armed Forces living in Military Camps;
- people living in residences for senior citizens; and
- people living full time in institutions: for example, inmates of penal institutions and chronic care patients living in hospitals and nursing homes.

The survey covers about 98% of the population in the ten provinces. In the Territories, coverage was restricted to 88% in the Yukon, 92% in the Northwest Territories, and 89% in Nunavut.

Information was not gathered from persons temporarily living away from their families (for example, students at university), because it would be gathered from their families if selected. In this way, double counting of such individuals was avoided.

Data from part-year households were excluded from estimates of average household spending. However, these data were included in the estimates for dwelling characteristics and household equipment and in the calculation of the Survey of Household Spending response rate. Data from part-year households are also required as input into Canada's System of National Accounts. Part-year households are composed entirely of persons who were members of other households for part of the reference year. There were 516 part-year households in the sample in 2001.

Survey Content and Reference Period

Detailed information was collected about expenditures for consumer goods and services, changes in assets, mortgages and other loans, and annual income. This information was collected for the calendar year 2001 (the survey reference year). Information was also collected about dwelling characteristics (e.g., type and age of heating equipment) and household equipment (e.g., appliances, communications

¹ In order to reduce response burden for northern households, the SHS is conducted in the north only every second year, starting in 2001.

equipment, and vehicles). This type of information was collected as of December 31st of the reference year.

Because the Survey of Household Spending is designed principally to provide detailed information on non-food expenditures, only an overall estimate of food expenditure is recorded. Detailed information on food expenditure is provided by the Food Expenditure Survey, which is conducted every four to five years. It was last conducted in 2001. In February 2003, the results were published in *Food Expenditure in Canada, 2001*, Catalogue no. 62-554-XIE.

The Sample

The sample size for the 2001 Survey of Household Spending was 22,172 eligible households.

This sample was a stratified, multi-stage sample selected from the Labour Force Survey (LFS) sampling frame. Sample selection comprised two main steps: the selection of clusters (small geographic areas) from the LFS frame and the selection of dwellings within these selected clusters. The LFS sampling frame mainly uses 1991 Census geography and 1991 population counts.²

Data Collection

The 2001 Survey of Household Spending was conducted from January to March 2002. Data were collected during a personal interview using a paper questionnaire. A copy of this questionnaire is available on request.

Data Processing and Quality Control

Data entry and automated editing for the 2001 Survey of Household Spending took place in the Statistics Canada regional offices. This allowed respondents to be contacted in the event that more information was required to resolve an inconsistency on their questionnaires.

After data entry, an automated edit system checked for data entry errors. Data had to pass a two-tier edit system consisting of "must-pass" edits that checked questionnaires for logic and consistency, and "warnings" that indicated that a particular situation was unusual and could require correction. The invocation of either type of edit resulted in the intervention of a member of one of the specially trained edit resolution teams. Further editing of the data took place in head office where invalid responses were corrected.

Missing responses were imputed using the nearest neighbour method. Statistics Canada's Canadian Census Edit and Imputation System (CANCEIS) was used to insert values from donor records having similar characteristics, chosen specifically to fit the variable. For example, total household income was used for most variables; dwelling type, household size and province were also frequently used.

Tabulation for the 2001 Survey of Household Spending was accomplished using a PC/client server-based system. This system provides tools (database querying, searching, and viewing capabilities) for spotting systematic errors.

² A detailed description of the Labour Force Survey sampling frame can be found in *Methodology of the Canadian Labour Force Survey*, Statistics Canada, Catalogue no. 71-526-XPB.

Weighting

The estimation of population characteristics from a sample survey is based on the premise that each sampled unit represents a certain number of units in the population. A basic survey weight was attached to each record in the sample to reflect this representation. These basic weights were adjusted for non-response for each of 17 selected metropolitan areas and 43 additional geographical areas and for 6 high-income strata. The 43 additional geographical areas comprise the remaining metropolitan areas and urban and rural areas based on census definitions but do not necessarily correspond exactly. For definitions of these terms, refer to the *1996 Census Dictionary*, Catalogue no. 92-351-XPE.

To increase the reliability of the estimates, weights were adjusted to ensure that estimates based on relevant characteristics of the population would respect population totals from sources other than the survey. For the ten provinces, there are two sets of totals.

The first set of totals, for age/sex groups, household size and household type at the province level, is based on projections at mid-January 2002 using the 1996 Census of Population (adjusted for net undercoverage). Controls for 18 age/sex groups are used. These are combined with totals for one-person households, two-person households and more than two-person households. There are also totals for the number of single-parent families and couples with never-married children.

Because of their smaller population, only two age/sex groups were used for the three territories (Yukon, Northwest Territories and Nunavut): number of persons under 18, and number of persons 18 and over, combined with the totals for one-person households, two-person households and more than two-person households for Yukon and Northwest Territories and total number of households for Nunavut. For the 17 selected metropolitan areas, only two age groups are used: number of persons under 18, and number of persons aged 18 and over.

The second set of totals is derived from T4 information from Canada Customs and Revenue Agency (CCRA, formerly Revenue Canada) and is intended to ensure that the weighted distribution of income (based on wages and salaries) in the data set matches that of the Canadian population.

The switch from 1991 to 1996 Census-based population totals and the use of T4 information from CCRA were introduced starting with the 1999 SHS. Revised SHS estimates for earlier survey years are available and should be used for year-over-year comparisons.

Data Quality

Sampling Error

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The sample design, the variability of the data, and the sample size determine the size of the sampling error. In addition, for a given sample design, different methods of estimation will result in different sampling errors.

The design for the 2001 Survey of Household Spending was a stratified multi-stage sampling scheme. The sampling errors for multi-stage sampling are usually higher than for a simple random sample of the same size. However, the operational advantages outweigh this disadvantage, and the fact that the sample is also stratified improves the precision of estimates.

Data variability is the difference between members of the population with respect to spending on a specific item or the presence of a specific dwelling characteristic or piece of household equipment. In general, the greater these differences are, the larger the sampling error will be. In addition, the larger the sample size, the smaller the sampling error.

Standard Error and Coefficient of Variation

A common measure of sampling error is the standard error (SE). Standard error is the degree of variation in the estimates as a result of selecting one particular sample rather than another of the same size and design. It has been shown that the "true" value of the characteristic of interest lies within a range of ± 1 standard error of the estimate for 68% of all samples, and ± 2 standard errors for 95% of all samples.

The coefficient of variation (CV) is the standard error expressed as a percentage of the estimate. It is used to indicate the degree of uncertainty associated with an estimate. For example, if the estimate of the number of households having a given dwelling characteristic is 10,000 households, and the corresponding CV is 5%, then the "true" value is between 9,500 and 10,500 households, 68% of the time and between 9,000 and 11,000 households, 95% of the time.

Standard errors for the 2001 Survey of Household Spending were estimated using the jackknife technique, which leads to a slight over-estimation and is, thus, conservative. For more information, refer to the Statistics Canada publication, *Methodology of the Canadian Labour Force Survey*, Catalogue no. 71-526-XPB.

Coefficients of variation are available in the User Guide for the Survey of Household Spending, 2001. This is available free of charge by special request (call Client Services, Income Statistics Division, 1-888-297-7355) and also at the Statistics Canada web site (www.statcan.ca). On the "Our products and services" page, choose "Free Internet publications"; then "Personal finance and household finance"; then "Household expenditure research papers series" (Catalogue no. is 62F0026MIE).

Data Suppression

For reliability reasons, estimates with CVs greater than 33% should be suppressed. Since CVs are not calculated for all estimates, data suppression for the Survey of Household Spending has been based on a relationship between the CV and the number of households reporting expenditure on an item. Analysis of past survey results indicates that CVs usually reach this level when the number of households reporting an item drops to about 30. Therefore, data have been suppressed for spending on items reported by fewer than 30 households.

However, data for suppressed items do contribute to summary level variables. For example, the expenditure for a particular category of clothing might be suppressed but this amount forms part of the total expenditure estimate for clothing.

Non-Sampling Error

Non-sampling errors occur because certain factors make it difficult to obtain accurate responses or responses that retain their accuracy throughout processing. Unlike sampling error, non-sampling error is not readily quantified. Four sources of non-sampling error can be identified: coverage error, response error, non-response error, and processing error.

Coverage Error

Coverage error results from inadequate representation of the intended population. This error may occur during sample design or selection, or during data collection and processing.

Response Error

Response error may be due to many factors, including faulty design of the questionnaire, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. In the Survey of Household Spending, the difference between receipts and disbursements is calculated as a check on respondents' recall. This important quality control tool involves the balancing of receipts (income and other money received by the household) and disbursements (total expenditure plus the variable *Money flows—assets, loans, and other debts*) for each questionnaire. If the difference is greater than 10% of the larger of receipts or disbursements, respondents are contacted again for additional information. This ensures that expenditures, at least at the aggregate level, are commensurate with household income and other sources of funds.

Several features of the survey help respondents recall their expenditures as accurately as possible. First, the survey period is the calendar year because it is probably more clearly defined in people's minds than any other period of similar length. Secondly, expenditure on food (about 11% of the average budget in 2001) can be estimated as either weekly or monthly expenses depending on the respondent's purchasing habits. Thirdly, expenses on smaller items purchased at regular intervals are usually estimated on the basis of amount and frequency of purchase. Purchases of large items (automobiles, for example) are recalled fairly easily, as are expenditures on rent, property taxes, and monthly payments on mortgages. However, even with these items, the accuracy of data depends on the respondent's ability to remember and willingness to consult records.

Non-Response Error

Non-response error occurs in sample surveys because not all potential respondents cooperate fully. The extent of non-response varies from partial non-response to total non-response.

Total non-response occurs when the interviewer is either unable to contact the respondent, no member of the household is able to provide information, or the respondent refuses to participate in the survey. Total non-response is handled by adjusting the basic survey weight for responding households to compensate for non-responding households. For the 2001 Survey of Household Spending, the overall response rate was 76.2 %. See Figure 1 for provincial and territorial response rates.

In most cases, partial non-response occurs when the respondent does not understand or misinterprets a question, refuses to answer a question, or is unable to recall the requested information. Imputing missing values compensates for this partial non-response.

The importance of the non-response error is unknown but in general this error is significant when a group of people with particular characteristics in common refuse to cooperate and where those characteristics are important determinants of survey results.

Processing Error

Processing errors may occur in any of the data processing stages, for example, during data entry, editing, weighting, and tabulation. See Data Processing and Quality Control (above) for a description of the steps taken to reduce processing error.

Figure 1

Response Rate, Canada and Provinces/Territories, 2001

	Eligible households ¹	Non- contacts	Refusals	Un- usables ²	Usables	Response rate ³ %
Newfoundland and Labrador	1,753	94	189	37	1,433	81.7
Prince Edward Island	786	36	84	6	660	84.0
Nova Scotia	2,097	141	313	90	1,553	74.1
New Brunswick	1,898	85	265	53	1,495	78.8
Quebec	2,669	173	391	41	2,064	77.3
Ontario	3,351	245	697	259	2,150	64.2
Manitoba	1,816	60	220	32	1,504	82.8
Saskatchewan	1,861	76	250	54	1,481	79.6
Alberta	2,260	73	363	79	1,745	77.2
British Columbia	2,677	102	494	83	1,998	74.6
Yukon	345	13	70	11	251	72.8
Northwest Territories	412	25	23	6	358	86.9
Nunavut	247	19	18	1	209	84.6
Canada	22,172	1,142	3,377	752	16,901	76.2

¹ Part-year households are included in the calculation of response rates. There were 516 part-year households in 2001.

² Rejected at the editing stage.

³ Usable/eligible*100.

The Effect of Large Values

For any sample, estimates can be affected by the presence or absence of extreme values from the population. These extreme values are most likely to arise from positively skewed populations. The nature of the subject matter of the Survey of Household Spending lends itself to such extreme values. Estimates of totals, averages and standard errors may be greatly influenced by the presence or absence of these extremes.

Comparability Over Time

Conducted since 1997, the Survey of Household Spending integrates most of the content found in the Family Expenditure Survey and the Household Facilities and Equipment Survey. Many variables from these two surveys are comparable to those in the Survey of Household Spending. However, some differences related to the methodology, to data quality and to definitions must be considered before making comparisons.

For more information, refer to *Note to Former Users of Data from the Family Expenditure Survey*, Catalogue no. 62F0026MIE2000002 and *Note to Former Users of Data from the Household Facilities and Equipment Survey*, Catalogue no. 62F0026MIE2000003. Both documents are available free of charge on the Statistics Canada web site (www.statcan.ca).

Historical data from the 1997 and 1998 Surveys of Household Spending, the 1996 Family Expenditure Survey and the 1996 Household Facilities and Equipment Survey have been or will be re-weighted using the weighting methodology described in the section "Weighting". Historical comparisons between data from those surveys and data from recent years of the Survey of Household Spending should generally be made with re-weighted data, although the differences between survey estimates from the old and new methodologies appear to be minimal at a summary level. Certain populations or variables, however, may be more strongly affected.

For 2001 only, extra questions were included in the survey so that data from the Survey of Household Spending could be used in the weighting of the Consumer Price Index. This change may affect historical comparisons for a few variables. For example, questions were added under "Personal care preparations" to collect specific information about hair care products, makeup, fragrances, deodorants and oral hygiene products. As a result of these extra questions, respondents may have given more precise information and the increase in the estimate for "Personal care preparations" may have been at least partly caused by an improvement in respondent recall. The effect of additional questions on estimates is difficult to quantify.

Definitions

General Concepts

Survey universe: The 2001 Survey of Household Spending has two reference periods and therefore two survey universes. Expenditure data are collected for the calendar year 2001. Dwelling characteristics and data about household equipment are collected as of December 31, 2001.

Tabulation: Expenditure data are tabulated for full-year households only. Dwelling characteristics and household equipment data are tabulated for full-year and part-year households.

Household: A person or group of persons occupying one dwelling unit is defined as a "household". The number of households, therefore, equals the number of occupied dwellings. A full-year household has at least one full-year member; a part-year household is composed entirely of part-year members.

Household member: A full-year member was a member of the household for the entire year. A part-year member was a member of the household for less than 52 weeks. Expenditure and income information for part-year members is collected for the portion of the year during which they were members of the household or members of another household no longer in existence.

Reference person: The household member being interviewed chooses which household member should be listed as the reference person after hearing the following definition. "The household reference person is the member of the household mainly responsible for its financial maintenance (e.g., pays the rent, mortgage, property taxes, electricity). This person can be either male or female. When all members of the household share equally, any member may be shown as the reference person." This person must have been a member of the household on December 31st of the reference year.

Reimbursed expenditures are excluded from the tabulations (e.g., work-related expenses or expenditures covered by insurance).

Expenses attributable to a business are excluded from the tabulations.

Negative expenditures: Certain values (*Separate sale of automobiles and trucks, Winnings from games of chance, and Tax refunds*) are presented in the data tables as "negative expenditures" since they represent a flow of money into the household instead of out of it.

Expenditures collected: With some minor exceptions, the survey includes spending on all goods and services *received* in 2001 whether paid for before or after 2001 (such as on an installment plan).

Taxes included: All expenditures include the Goods and Services Tax, provincial retail sales taxes, tips, customs duties and any other additional charges or taxes.

Gifts: Any expenditure may include gifts given to persons outside the household. Only the value of gifts of clothing is reported separately, as well as being included in the summary clothing category. See also the definition of "Gifts of money and contributions".

Insurance settlements: Where an insurance settlement was used to repair or replace property, the survey includes only the deductible amount paid for an item.

Trade-ins: Where a trade-in is used to lower the price of an item, most commonly a vehicle, the expenditure amount is the total cost after the trade-in. Real estate transactions are excepted.

Household Characteristics

(presented in the same order as they appear on the data tables)

Number of households in sample: This refers to the number of households used for data estimation, which includes the number of households sampled, minus vacant dwellings, ineligible households, households that interviewers were unable to contact, households that refused to be interviewed, and households whose questionnaires did not pass editing procedures. For expenditure data tables, only full-year households are included. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included. See *Household* under "General Concepts".

Estimated number of households is the estimated (weighted) number of private households on December 31st of the reference year. For expenditure data tables, the estimate is based on full-year households only. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included in the estimate. See *Household* under "General Concepts".

Average household size is the average number of people in a household. In this context, household size is defined as the number of year-equivalent persons. The number of year-equivalent persons is calculated by dividing the number of weeks that members were part of the household by 52. In this way, part-year members are counted as fractions of a year-equivalent person.

Average household income before tax: This variable includes total household income received in calendar year 2001, including gross income from wages and salaries, net income from self-employment, receipts from military pay and allowances, gross receipts from roomers and boarders not related to the reference person, net rentals, interest and dividends, all pensions, workers' compensation and employment insurance benefits, social assistance and income supplements, Child Tax Benefits, Goods and Services Tax Credits, provincial tax credits, and miscellaneous regular income receipts.

Other money receipts refers to other receipts not included in income such as cash gifts, inheritance, or life insurance settlements. Winnings from games of chance are also included if they exceed the amount spent on games of chance.

Money flows—assets, loans and other debts includes net changes during the reference year (calendar year 2001) in bank balances; money on hand; money owed to the household; money owed by the household; purchase and sale of stocks and bonds, personal property, and real estate; expenditures on home additions, renovations and new installations; and contributions to and withdrawals from registered retirement savings plans.

The Family Expenditure Survey, last conducted in 1996, had a similar variable called *Average net change in assets and liabilities*. For a complete description of the differences between the two variables, see *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Percentage homeowners (December 31, 2001) is the percentage of households living in a dwelling owned (with or without a mortgage) by a member of the household at December 31st of the reference year.

Average age of reference person: This variable acts as a general age indicator for the household and uses the reference person's age in years as of December 31st. Prior to 1996, in the Family Expenditure Survey, the age of the husband was used for couple households and the age of the reference person for all other households. See *Reference person* under "General Concepts".

Selected Household Expenditures

(presented in the same order as they appear on the data tables)

Total expenditure includes *Total current consumption*, *Personal taxes*, *Personal insurance payments and pension contributions*, and *Gifts of money and contributions*.

Caution should be used when comparing total expenditure to total expenditure from 1996 and earlier. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Total current consumption shows the expenses incurred during the reference year for food, shelter, household operations, household furnishings and equipment, clothing, transportation, health care, personal care, recreation, reading materials, education, tobacco products and alcoholic beverages, games of chance, and a miscellaneous group of items.

Caution should be used when comparing total current consumption to total current consumption from 1996 and earlier. Prior to 1997, expenditures for gifts were not included in total current consumption. Starting in 1997, these expenditures are reported in the appropriate spending category and, therefore contribute to total current consumption. See also "Shelter" and "Miscellaneous".

Food purchased from stores: "Stores" includes frozen food provisioners, outdoor farmers' markets and stands, and all other non-service establishments.

Food purchased from restaurants: "Restaurants" includes refreshment stands, snack bars, vending machines, mobile canteens, caterers and coffee wagons.

Shelter includes expenditures on principal accommodation (either owned or rented) and on other accommodation such as vacation homes or accommodation while travelling.

Expenditure on owned principal accommodation includes regular mortgage payments, if any. This definition of shelter differs from that of the Family Expenditure Survey last conducted in 1996. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website.

Rent refers to the net household expense for rent after adjusting for rebates and for any use of the dwelling for business. No adjustment for partial subletting to non-household members is made. Receipts from this activity are considered part of household income.

Tenants' insurance/Homeowners' insurance are the premiums paid in 2001 for fire and comprehensive policies. Premiums covering more than the reference year were not prorated.

Maintenance, repairs and replacements (owned living quarters) covers expenditures for work contracted out, labour cost, and materials purchased separately for all types of maintenance, repairs and replacements. This variable includes expenditures on built-in appliances and other equipment and fixture replacements. Money spent on additions, renovations and new installations is considered to contribute to an increase in assets and is included in *Money flows—assets, loans and other debts*.

An annual data series showing household expenditures on repairs and renovations is available from the Homeowner Repair and Renovation Survey. See *Homeowner Repair and Renovation Expenditure*, Catalogue no. 62-201.

Property taxes and sewage charges refer to the amount billed, excluding any rebates. Special service charges (e.g., garbage, sewage), local improvements, and water charges are included if these are part of the property tax bill. Property taxes that are included in condominium charges are excluded.

Electricity: Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

Traveller accommodation excludes accommodation that was part of a travel tour (which is included in *Package travel tours*).

Household appliances refers to the net purchase price after deducting trade-in allowance and any discount. This variable excludes appliances included in the purchase of a home and built-in appliances. Expenditures on household fixtures (e.g., built-in appliances and wall-to-wall carpeting) can be reported under the appropriate expenditure item or, if they were part of a larger job, *under Additions, renovations etc. to a home*, or *Maintenance, repairs and replacements*.

Purchase of automobiles and trucks refers to the net purchase price, including extra equipment, accessories, and warranties bought when the vehicle was purchased, after deducting any trade-in allowance or separate sales. (Separate sales occur when a vehicle is sold independently by the owner, e.g., not traded-in when purchasing or leasing another vehicle.)

Health care includes direct (out-of-pocket) costs and expenditures on insurance premiums. The distinction between premiums for private health insurance plans and publicly funded (provincial) plans is not always clear to respondents. Interviewers are trained to assist, but the variations in coverage and administration among the various provincial health care regimes makes this a difficult task. For this reason, more confidence can be placed in the overall estimate for *Health insurance premiums* than in the components *Public hospital, medical and drug plans* and *Private health insurance plans*.

Package travel tours includes at least two components such as transportation and accommodation, or accommodation with food and beverages.

Tobacco and smokers' supplies includes cigarettes, tobacco, cigars, matches, pipes, lighters, ashtrays, cigarette papers and tubes, etc. Purchases of tobacco products and smokers' supplies are frequently under-reported.

Alcoholic beverages includes those purchased from stores and restaurants. Also included are expenditures on supplies and fees for self-made beer, wine or liquor. Purchases of alcoholic beverages are frequently under-reported.

Games of chance (net) equals the sum of expenditures on all types of games of chance minus the sum of winnings from all types of games of chance. If total winnings are greater than total expenditures, the amount to be subtracted from expenditures is set to \$1 less than the expenditures and the value of the remaining winnings is moved to the variable *Other money receipts*. Expenditures on games of chance are frequently under-reported.

Miscellaneous expenditures includes expenses on other owned property (not principal accommodation or vacation home), legal services not related to dwellings, financial services, dues to unions and professional associations, contributions and dues for social clubs and other organizations, forfeits of deposits, fines, money lost or stolen, the purchase of tools and equipment for work, and other miscellaneous goods and services.

Caution should be used when comparing current data for *Miscellaneous expenditures* to data from the Family Expenditure Survey (1996 or earlier). For a complete description of the differences between the two variables, see Note to former users of data from the Family Expenditure Survey (62F0026MIE2000002) available free on the Statistics Canada website.

Personal taxes are income taxes paid in 2001 on 2001 and previous years' incomes plus other personal taxes (e.g., gift taxes, Newfoundland and Labrador school tax) minus income tax refunds received in 2001. Tax credits, such as Federal Child Tax Benefits, Goods and Services Tax Credits and provincial tax credits, are included in *Average household income before taxes*.

Personal insurance payments and pension contributions includes payments for life insurance, annuities, employment insurance, public and private pension plans, and similar items. For certain uses of the data, some of these items might be regarded as savings, although the relationship between the expenditure and any increase in savings may not be easily determined. This category of expenditure was called *Security* prior to the 1996 survey. (Registered retirement savings plan (RRSP) contributions are included in *Money flows—assets, loans and other debts*.)

Gifts of money and contributions includes money and support payments given to persons outside the household or to charity. This does not include money spent on gifts to persons outside the household as was the case in the Family Expenditure Survey.

Alimony: This variable is available starting in 1998. Before 1998, expenditures on alimony were included under *Gifts of money and other support payments to persons living inside Canada* or *Gifts of money and other support payments to persons living outside Canada*.

Dwelling Characteristics

Dwelling characteristics are collected as of December 31st.

Type of dwelling: This variable describes the type of dwelling in which the household resided on December 31st. A dwelling is a structurally separate set of living premises with a private entrance from outside the building or from a common hall or stairway.

A *single detached* dwelling contains only one dwelling unit and is completely separated by open space on all sides from any other structure, except its own garage or shed.

A *single attached* dwelling is a double or semi-detached unit (side-by-side) or a row or terrace unit.

The classification *apartment* includes duplexes (two dwellings, situated one above the other), triplexes, quadruplexes or apartment buildings.

Other dwellings include mobile homes, motor homes, tents, railroad cars or house-boats, which are used as permanent residences and are capable of being moved on short notice.

Repairs needed: This variable indicates the respondent's perception of the repairs the dwelling needed on December 31st to restore it to its original condition. Remodeling, additions, conversions, or energy improvements that would upgrade the dwelling over and above its original condition are not included.

Major repairs include serious deficiencies in the structural condition of the dwelling, as well as the plumbing, electrical and heating systems. Examples include corroded pipes, damaged electrical wiring, sagging floors, bulging walls, damp walls and ceilings, crumbling foundation.

Minor repairs include deficiencies in the surface or covering materials of the dwelling and less serious deficiencies in the plumbing, electrical and heating systems. Examples include small cracks in interior walls and ceilings, broken light fixtures and switches, cracked or broken panes, leaking sinks, missing shingles or siding, peeling paint.

Regular maintenance includes painting, fixing leaking faucets, clogged gutters or eavestroughs, etc.

Tenure: This variable gives the housing status of the household on December 31st. Note that housing tenure may also refer to the entire reference year. See "Housing tenure" under "Classification Categories for Standard Tables".

Owned with mortgage indicates that the dwelling is owned by a household member and that there is a mortgage as of December 31st.

Owned without mortgage indicates that the dwelling is owned by a household member and that there is no mortgage as of December 31st.

Rented indicates that the dwelling is rented by the household for the entire reference year or occupied rent-free as of December 31st.

Year of move: This item refers to the year the household moved into the dwelling. If the dwelling was occupied by previous generations, the first year of residence for the household member who has occupied the dwelling the longest is recorded.

Period of construction (for dwelling occupied on December 31st): This variable gives the year or period in which the original building was constructed.

Number of rooms (for dwelling occupied on December 31st): This variable includes the kitchen, bedrooms, and finished rooms in the attic or basement. It excludes bathrooms, halls, vestibules and rooms used solely for business purposes.

Number of bathrooms (for dwelling occupied on December 31st): This variable indicates the number of rooms in the dwelling with an installed bathtub and/or shower.

Principal heating equipment (for dwelling occupied on December 31st): This variable indicates the type of heating equipment chiefly used to heat the dwelling in winter.

Steam or hot water furnaces distribute central heating through radiators located throughout the house and connected by pressure pipes.

Forced hot air furnaces distribute central heating by a motor-driven fan through vents located throughout the dwelling. (This is the most common central heating system.) Furnaces with a pump are included in this category.

Other hot air furnaces distribute central heating by convection (natural) flow of hot air through vents located throughout the house. Gravity furnaces are included in this category.

Heating stoves are localized heating units with no central distribution system to other parts of the house (e.g., oil space heater, gas space heater, wood stoves).

Electric heating includes permanently installed baseboard electric heating and other types such as floor or ceiling heating wires in all or most rooms.

Other heating includes cookstoves and any other type of heating equipment not listed above.

Age of principal heating equipment installed (for dwelling occupied on December 31st) indicates how long ago the principal heating equipment was installed.

Principal heating fuel (for dwelling occupied on December 31st): The principal winter fuel used in the principal heating equipment is given here (e.g., oil or other liquid fuel, piped or bottled gas, electricity, wood or other fuels).

Principal heating fuel for hot water (for dwelling occupied on December 31st) indicates the type of fuel used for the running hot water supply (e.g., oil or other liquid fuel, piped gas, electricity or other fuels such as bottled gas or wood).

Principal cooking fuel (for dwelling occupied on December 31st) indicates the main fuel for the range or stove on which the household does most of the cooking (e.g., piped gas, electricity or other cooking fuels). "Other" includes oil or other liquid fuel, bottled gas and wood.

Household Equipment (at December 31st)

In general, appliances and equipment are included if they are in working order or will soon be repaired, and are located within the dwelling occupied on December 31st. They must be owned or leased for the exclusive use of the household.

Washing machine: Washing machines located outside the dwelling and shared with other households are excluded.

Clothes dryer: Clothes dryers located outside the dwelling and shared with other households are excluded. Dryers may be electric or gas.

Dishwasher: Dishwashers may be built-in or portable.

Freezer: A freezer is an individual piece of equipment and not part of a refrigeration unit such as the freezer in a refrigerator.

Air conditioner: A central air conditioner is designed to cool the air in the entire building and may be located either inside or outside the dwelling unit, for example, in the basement of an apartment block. A window-type air conditioner is installed in a window or through a wall to cool the air in a room.

Telephone (includes business use): Telephones used for business are included if the business is conducted in the dwelling. Cordless phones are included. Cellular telephones are excluded.

Cellular telephone: Cordless phones are excluded.

Compact disc player: A compact disc player may be a separate unit, part of a component or built in (as in a receiver/cassette recorder/compact disc combination unit).

Video cassette recorder: Video cassette recorders (VCRs) are units which play videocassettes when attached to a television or monitor.

Home computer: Computers used exclusively for business purposes are not included.

Internet use from home: This variable indicates whether the household accesses the Internet via a computer in the house. It includes cases where a home computer is used to link to a business computer located outside the dwelling for access to the Internet. Excluded are cases where the Internet is accessed directly through a computer located outside the dwelling (e.g., work).

Owned vehicles: This variable gives the number of vehicles (car, van/mini-van, truck/sport utility vehicle) owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned automobiles: gives the number of automobiles owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned vans or trucks: gives the number of vans, minivans, trucks and sport utility vehicles owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Classification Categories for Standard Tables

Canada: In 1998, 1999, and every second year thereafter starting with 2001, statistics for Canada include the territories. For the other years, Canada-level statistics include the ten provinces only.

Province/Territory refers to the major political divisions of Canada. Data for territories are available for 1997 (coverage insufficient for inclusion in Canada-level statistics), 1998, 1999 and every second year thereafter starting with 2001.

Metropolitan Areas: The overall concept for delineating metropolitan areas is one of a large urban area together with adjacent urban and rural areas that have a high degree of social and economic integration with this urban area (see the *1996 Census Dictionary*, p. 181, Catalogue no. 92-351-XPE).

For the Survey of Household Spending, data are tabulated based on the 1996 census metropolitan area (CMA) boundaries. In the Survey of Household Spending, only data for the Ottawa, Ontario part of the Ottawa–Gatineau CMA, are tabulated for the metropolitan area. The data for Gatineau, Quebec part, are included in the data tabulated for the province of Quebec and Canada (ten provinces). Also, the municipality of Selkirk is included in the Survey of Household Spending metropolitan area of Winnipeg, whereas it is not included in the CMA of Winnipeg.

The metropolitan areas for which the data are tabulated are: St. John's, Charlottetown–Summerside, Halifax, Saint John, Quebec, Montreal, Ottawa, Toronto, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver, Victoria, Whitehorse, and Yellowknife.

Income: Readers requiring official income statistics are directed to the publication *Income in Canada*, Catalogue no. 75-202.³ In the SHS, income quintiles are used as classifiers in the data tables. In addition, *Average household income before tax* is a descriptive household characteristic found at the beginning of each expenditure table (see definition above under "Household Characteristics").

Household income quintiles: Income quintiles are income groupings obtained by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same.

In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household which falls on the threshold between two quintiles represents a number of households, some of which would be allocated to the lower quintile and some to the higher. Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four.

Custom tabulations of other income quintiles and various income groups are available subject to data quality restrictions. Contact Client Services at 1-888-297-7355.

Housing tenure refers to whether a household member owned or rented the dwelling(s) in which the household lived during the reference year (calendar year 2001). See also "Tenure" under "Dwelling Characteristics".

All owners refers to households living for the entire reference year in a dwelling owned (with or without mortgage) by a household member. See also "Percentage homeowners (December 31st)" under "Household Characteristics".

Owners without mortgage owned the dwelling for the entire reference year and had no mortgage on December 31st.

Owners with mortgage owned the dwelling for the entire reference year and had a mortgage on December 31st.

Renters rented a dwelling for the entire reference year (as a regular tenant, rent free, or with reduced rent).

Mixed tenure includes those households that both owned and rented during the reference year.

³ Traditionally, the Survey of Consumer Finances (SCF) has been the source of Statistics Canada's annual income estimates. Starting with data for the 1998 reference year, the Survey of Labour and Income Dynamics (SLID) becomes the major source of annual cross-sectional income estimates.

Household type: Households are divided into the following types:

Couple households are households where the married or common-law spouse of the reference person was a member of the household on December 31, 2001. This household type may be further broken down into couple households without children (without additional persons), with children (without additional persons), and with additional persons. "Children" are never-married sons, daughters, or foster children of the reference person and may be any age. "Additional persons" include sons, daughters and foster children whose marital status is other than "single, never-married", other relatives by birth or marriage, and unrelated persons.

Lone-parent households are households where no spouse of the reference person is present and there is at least one child (never-married son, daughter, or foster child of the reference person). The lone-parent households for which data are presented in this publication do not include any additional persons.

Other households may be broken down into households composed of relatives only and households having at least one unrelated person. Relatives may include:

- sons, daughters and foster children of the reference person whose marital status is other than "single, never-married";
- relatives of the reference person by birth or marriage (not spouse, son, daughter, or foster child);
- spouse of the reference person who was not present in the household on December 31, 2001;
- other households having at least one household member who is unrelated to the reference person (e.g., lodger, roommate, employee).

Size of area of residence: Sampled dwellings are assigned to the following groups depending on the 1996 population size (according to the 1996 census boundaries) of the metropolitan area, municipality, or area in which they are located.

Urban

- 1,000,000 and over
- 500,000 – 999,999
- 250,000 – 499,999
- 100,000 – 249,999
- 30,000 – 99,999
- under 30,000

Rural

Urban area: For the Survey of Household Spending (based on the LFS sampling frame), urban areas include:

- all larger metropolitan areas (even though they do contain some rural areas);
- most smaller metropolitan areas (also called census agglomerations). In some cases, where a census agglomeration contains a large rural population, only the urban portion is considered urban;
- urban areas based on the census definition: Urban areas have minimum population concentrations of 1,000 and a population density of at least 400 per square kilometre, based on the previous census population counts.

Rural area: All territory outside urban areas is considered rural. Taken together, urban and rural areas cover all of Canada.

Statistics Presented in the Standard Tables

Average expenditure per household is equal to the estimated total expenditures of all households divided by the estimated number of households. The average is based on all households in a column, including households that reported a zero value.

Percentage reporting is the percentage of households that reported purchasing an item. These percentages cannot be added together to form sub-totals.

Average expenditure per household reporting is calculated for those households that reported the expenditure, i.e., without zero values.

Percentage of total expenditure is calculated by expressing the average expenditure per household as a percentage of total expenditure. This statistic is also known as "budget share".

Detailed Tables

The information in this publication represents only a summary of the results available from the 2001 Survey of Household Spending. The following standard tables are also available:

62F0031	Detailed Average Household Expenditure for Canada, Provinces/Territories and Selected Metropolitan Areas
62F0032	Detailed Average Household Expenditure by Household Income Quintile for Canada and Provinces/Territories
62F0033	Detailed Average Household Expenditure by Housing Tenure for Canada
62F0034	Detailed Average Household Expenditure by Household Type for Canada
62F0035	Detailed Average Household Expenditure by Size of Area of Residence for Canada
62F0041	Dwelling Characteristics and Household Equipment for Canada, Provinces/Territories and Selected Metropolitan Areas
62F0042	Dwelling Characteristics and Household Equipment by Income Quintile for Canada
62F0043	Dwelling Characteristics and Household Equipment by Housing Tenure for Canada
62F0044	Dwelling Characteristics and Household Equipment by Household Type for Canada
62F0045	Dwelling Characteristics and Household Equipment by Size of Area of Residence for Canada

Custom Tabulations

Custom tabulations can be produced to your specifications on a contract basis (subject to confidentiality restrictions). Aggregate data at the detailed expenditure level (including both full-year and part-year households) are also available on a custom basis.

Public-use Microdata File

A public-use microdata file based on the 2001 survey is available. It contains household spending data, as well as data on household characteristics, dwelling characteristics, household facilities and equipment, and income for over 16,000 records. All records have been thoroughly screened to ensure the anonymity of respondents.

Public-use microdata files presenting spending data from previous family expenditure surveys are available for the following years: 1969, 1978, 1982, 1984, 1986, 1990, 1992 and 1996. Public-use microdata files presenting spending data from the 1997, 1998, 1999, and 2000 surveys of household spending are also available. As well, public-use microdata files presenting dwelling characteristics and household facilities and equipment data from previous household facilities and equipment surveys are available for every survey year since 1982 except 1983.

Household Expenditures Research Papers Series

This series provides detailed documentation on issues, concepts, methodology, data quality and other relevant research related to household expenditures from the Survey of Household Spending, the Homeowner Repair and Renovation Survey, and the Food Expenditure Survey.

Examples of these research papers include the user guides for the Survey of Household Spending, 1992-2001; data quality indicators for the Survey of Household Spending, 1998-2001; and the *Methodology of the Survey of Household Spending*.

These research papers are available in English and French, free of charge, on the Statistics Canada web site (www.statcan.ca).

CANSIM

CANSIM (the Canadian Socio-Economic Information Management System) is a data base consisting of multi-dimensional cross-sectional tables.

Eighteen tables are available. They present annual information from the Survey of Household Spending about the spending habits of Canadian households by province and territory. These tables cover the survey years 1997 to 2001.

Table 203-0001 presents summary-level data, while tables 203-0002 to 203-0018 present detailed information.

Client Services

For clients with more specialized data needs, custom tabulations can be produced on a cost-recovery basis. For more information or to enquire about the concepts, methods, data quality or the product line, contact Client Services (1 888 297-7355 or 613 951-7355; income@statcan.ca), Income Statistics Division.

CANADIAN SOCIAL TRENDS

Unparalleled insight on Canadians

Subscribing to *Canadian Social Trends* means...

...GETTING THE SCOOP ON TOPICAL SOCIAL ISSUES

What's happening today? Each quarterly issue of *Canadian Social Trends* explores the realities that we are dealing with now.

... BEING ON THE FOREFRONT OF EMERGING TRENDS

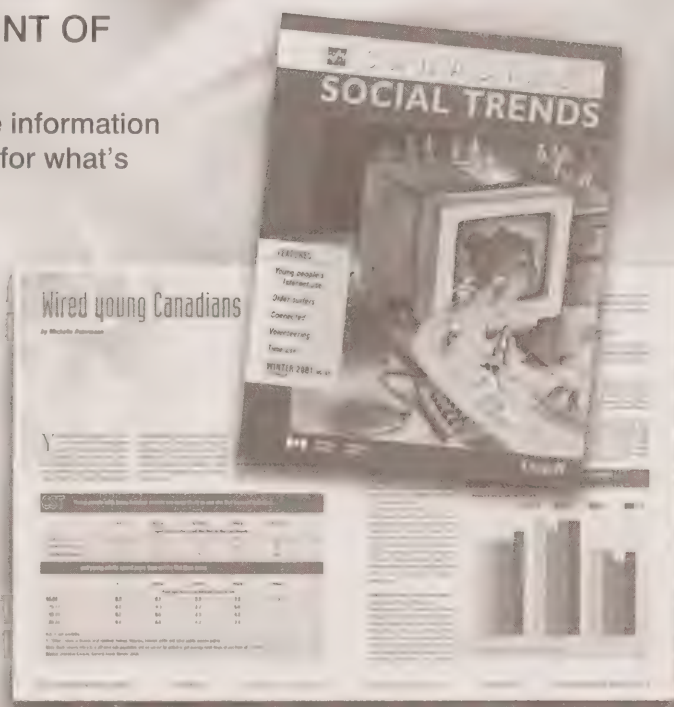

Canadian Social Trends gives you the information you need to understand and prepare for what's coming down the road.

...OBTAINING THE MOST ACCURATE DATA AVAILABLE ON CANADA

Experts analyze data collected by Statistics Canada, *the* first-hand source of information on Canada. You can rely on this data to be the latest and most comprehensive available.

Canadian Social Trends offers you insights about Canadians that you can use to develop pertinent programs, must-have products and innovative services that meet the needs of 21st century Canadians.

Take advantage of this opportunity today!

Subscribe now by using any one of the following methods:

Call toll-free 1 800 267-6677

Fax toll-free 1 877 287-4369

Email order@statcan.ca

Contact the Regional Reference Centre nearest you by calling 1 800 263-1136.

Canadian Social Trends is \$36 /year for a print subscription. In Canada, please add **either** GST and applicable PST **or** HST. No shipping charges for delivery in Canada. Please add \$6 per issue for shipments to the U.S. or \$10 per issue for shipments to other countries. Visit our Web site at www.statcan.ca for more information about ordering the online version of *Canadian Social Trends*. (A one-year electronic subscription is \$27 plus taxes.)

Income Trends in Canada

More than 2,000,000 facts at your fingertips!

Get the overall picture with nearly two decades of data for Canada, the provinces and 15 metropolitan areas

For \$195, you will find everything you need to know about income trends going back to 1980, through two recessions and recovery periods! Get accurate and reliable statistics about:

- ▶ income from employment... and other sources
- ▶ taxes
- ▶ impact of government transfers on family income
- ▶ differences in earnings between women and men
- ▶ income of Canada's seniors
- ▶ income inequality and low income
- ▶ and a lot more!

 In these times of rapid change, it is more crucial than ever before to understand income trends of Canadians

With *Income Trends in Canada*, tracking and understanding developments in Canadian incomes is easy!

Use this CD-ROM to view trends with one mouse click. Create your own tables. Chart income data. And more!

Need more details? Check out *Income Trends in Canada* on our Web site at <http://www.statcan.ca/english/ads/72-202-XIE/index.htm> or contact your nearest Statistics Canada Regional Reference Centre at 1 800 263-1136.

Order *Income Trends in Canada* TODAY

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service which its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1 800 263-1136.

ERRATA

Catalogue No. 62-202-XPE: Spending Patterns in Canada, 2002

In Table 8:

- The variable 3919 (All-terrain vehicles) is missing. It should appear between the variables 3917 and 3918.
- The variable 4150-4160 (Membership and single usage fees for sports and recreation facilities) wraps onto 2 rows, but the data should appear next to the second row only.

Please find attached replacement pages 97 to 100.

For further information, contact Client Services (1-888-297-7355 or 613-951-7355; income@statcan.ca), Income Statistics Division.

5550	Additions, renovations and alterations: contract, labour and material cost	1,310	23.9	5,474	
5555	New installations of equipment and fixtures: contract, labour and material cost	119	5.9	2,003	

1. Based on full-year households only (see "The survey universe" under "Notes and definitions").

2. Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

3. Values are presented here as a negative expenditure.

4. "Average expenditure per household reporting" was calculated using unrounded data. Note also that expenditures in this column do not add to sub-totals.

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Note

Due to reliability concerns, the average expenditure and percentage not reporting zero have been replaced by “F” in the tables for items reported by fewer than 30 households. This suppression criterion should not restrict valid use of the data since these items would normally have coefficients of variation of 30% or more. This symbol should not be interpreted as zero. The expenditure items are components of more reliable higher aggregates.

Highlights

Highlights of household spending, dwelling characteristics and household equipment in 2002

According to estimates from the 2002 Survey of Household Spending, households in Canada's 10 provinces spent an average of \$60,100 for all purchases combined, from food, shelter and clothing to recreation and travel. This is a 4.5% increase over the 2001 average of \$57,500 and well above the 2002 inflation rate, which was 2.2% according to the Consumer Price Index (CPI). All expenditure figures in this publication are in current dollars.

Shelter, food and clothing accounted for exactly the same share of the household budget as in 2001: 19%, 11% and 4.1% respectively. Personal taxes made up an estimated 20% of the average household budget, down slightly from 2001 (21%). Transportation consumed 14% of the budget, up from 13% in 2001.

Spending on transportation increased in 2002

Households spent an average of \$8,400 on transportation in 2002, up 11% from 2001. This was largely due to a 14% increase in spending to purchase cars and trucks, particularly minivans and sports utility vehicles.

In addition, spending on gas and other fuels for vehicles rose 11% to an average of \$2,000 for households reporting such purchases in 2002. According to the CPI, the price of gasoline remained steady in 2002.

Higher transportation spending was also attributable to increases in spending on public and private auto insurance premiums, which was up 16% in 2002 compared with the previous year. Average household spending on this item was \$1,100.

Average spending on public transportation, including air fares and urban and intercity transit, climbed 7.5% to \$700 in 2002.

Spending on shelter was up slightly in 2002

Households spent an average of \$11,200 on shelter in 2002, up 4.3% from the 2001 average of \$10,700. The increase was largely due to higher spending on owned living quarters, especially regular mortgage payments, utilities and property taxes. For the three main utilities – water, fuel and electricity – reporting households spent an average of \$2,100 in 2002, up 4.5% from 2001.

Spending on maintenance, repairs and replacements was reported by 38% of owner households in 2002. Reporting households spent an average of \$1,400 in 2002, down from \$1,500 the previous year. The property tax payments of households that reported such expenditures rose 3.4% to \$2,000 in 2002.

Average spending on fuel, such as oil and natural gas, for households that reported such expenses, was \$1,100, up 4.9%. Spending on electricity was \$1,200, up 3.1% from the previous year. According to the CPI, electricity prices were 7.7% higher in 2002 than in 2001.

Half of Canadian households heated their homes with natural gas¹

According to 2002 data, about 50% of Canadian households used natural gas as their principal energy source for heating, compared with 32% for electricity and 13% for oil. Provincial figures varied with the availability of the different fuels.

The survey results also indicate that the principal source of energy used for heating varies with tenure. Renters were twice as likely as owners to use electricity as their main source of energy for heating. About 46% of the estimated 4.1 million renter households heated with electricity, compared with only 24% of owners. Conversely, some 55% of the 7.6 million owner households reported using natural gas as their primary energy source for heating, compared with 41% of renters.

Spending on high tech continued to climb

The proportion of households that have a cell phone rose from 48% in 2001 to over half in 2002 (52%). Households spent an average of \$300 on cell phone services in 2002, 25% more than in 2001.

According to the 2002 Survey of Household Spending, more than half of the households (54%) reported using the Internet at home, up from 50% in 2001 and 42% in 2000. More than half of the households with Internet access reported having a high-speed connection (cable or high-speed telephone connection) in 2002, up from 41% the previous year.

In 2002, 64% of households reported owning a computer, compared with 60% in 2001 and 55% in 2000.

DVD players and CD burners continue to gain in popularity. About 36% of households reported having a DVD player, and 28% a CD burner, up from about 20% for each one in 2001.

The use of cable TV remained steady at 67% of households. However, 21% of households reported having a satellite TV dish, up from 18% the previous year.

Households that reported expenditures on Internet services spent an average of \$400 in 2002, up from \$300 in 2001.

However, the downward trend in household spending on computer equipment that began in 1996 continued in 2002. The average expenditure of reporting households was \$1,200 in 2002, 7.2% less than in 2001. Prices for computer equipment and supplies dropped 18% in 2002 compared with 2001, according to the Consumer Price Index.

Spending on food was higher than in 2001

Households spent an average of \$6,700 on food in 2002, up 3.9% from 2001. The household spent on average \$5,200 on food purchased from stores, 4.2% more than the previous year.

¹ Also includes households that use bottled gas as their main heating fuel. However, such households make up a negligible percentage of the total.

The increase in food expenditure was also partly attributable to higher spending on restaurant meals, which rose 2.7% to \$1,500 in 2002. Spending in restaurants made up 22% of total food expenditure.

Household spending on health care and pension plans increased in 2002

Average spending on health care by Canadian households rose 12% to \$1,600 in 2002. The increase is partly due to higher spending on health insurance premiums, which increased by 13% between 2001 and 2002. The average premiums paid by households reporting such expenses (55%) in 2002 were estimated at \$1,000. Health insurance premiums include payments for public hospital, medical and drug plans, where they exist, and payments for private health insurance plans, including dental care coverage and accident and disability insurance.

Household spending on personal insurance and pension contributions, excluding registered retirement savings plans, increased 9.3% to \$3,400 in 2002, chiefly because of higher Canada and Quebec Pension Plan contributions. Average Registered Retirement Savings Plan (RRSP) contributions fell 4.2% to \$1,600 in 2002.

Little change in household spending on personal taxes

The average household spending on personal taxes showed no significant change, decreasing only slightly to \$12,000 in 2002, compared to \$12,200 the previous year. The proportion of the average household budget represented by personal taxes in 2002 was 20%, the corresponding figure for 2001 being 21%.

Higher spending on games of chance and tobacco products

Net spending on games of chance averaged \$300 per household, up nearly 18% from 2001.

Average spending on tobacco products jumped 19% to \$700 in 2002. However, most of the increase stems from a 32% rise in the price of tobacco products according to the Consumer Price Index. The proportion of households reporting spending on tobacco products declined over the last 10 years, from 47% in 1992 to 39% in 2002.

Alberta households were Canada's biggest spenders

In 2002, households in Alberta reported higher spending than households in any other province, averaging \$67,700, while households in Newfoundland and Labrador had the lowest average spending, at \$48,000. Household spending was also above the national average in Ontario and British Columbia.

Focus on the Toronto, Montréal and Vancouver metropolitan areas showed that Toronto households spent more on shelter

Toronto households spent an average of \$15,400 on shelter in 2002, compared with \$13,700 for Vancouver households and \$10,200 for Montréal households. It is important to note that although half of Montréal's households were owners in 2002, while 61% of Toronto and Vancouver households owned their residences, the rankings of the three cities remained the same whether shelter costs for either owners or renters were compared. The situation was somewhat different for property taxes. Toronto households spent the highest amount, \$1,900, on property taxes, while Montréalers spent \$1,400 and Vancouver households averaged \$1,300.

Food, shelter and clothing accounted for over half of the expenses of lowest-income households

In 2002, households in the lowest income quintile spent an average of \$20,200, while households in the top quintile spent \$120,200.

The 20% of Canadian households with the lowest income spent 52% of their budgets on food, shelter and clothing in 2002, compared with just 3.8% on personal income taxes. In contrast, the 20% of households with the highest income spent 28% of their budgets on food, shelter and clothing and the same percentage on personal income taxes.

While there was a substantial difference in transportation expenditures between the lowest and highest quintiles (\$2,400 for the former and \$16,000 for the latter), the budget share allocated to transportation was similar for all income levels.

Couple households with children were more likely to have Internet access at home than lone-parent households

In 2002, 77% of couple households with children had Internet access from home, compared with only 52% of lone-parent households. However, the rate of Internet access from home is growing more rapidly for lone-parent households. Between 2001 and 2002, Internet access from home increased 9.2% for lone-parent households, compared with 7.5% for couples with children.

Lone-parent households headed by women were more likely than lone-parent households headed by men to have Internet access. Specifically, 53% of female lone-parent households used the Internet directly from home, compared with 48% of male lone-parent households.

Seniors spend less on recreation

In 2002, senior husband-wife households spent \$2,400 on all recreation items combined, from the use of recreation facilities to the purchase of recreation vehicles, home entertainment equipment, various types of entertainment, and package travel tours. This was well below the national average of \$3,500. However, 98% of senior husband-wife households reported such expenditures, the same proportion as the average for all Canadian households.

Introduction

This report presents the results of the 2002 Survey of Household Spending,¹ conducted January through March 2003. Information about the spending habits, dwelling characteristics and household equipment of Canadian households was obtained by asking people across Canada to recall their expenditures for the previous calendar year and their dwelling characteristics and household equipment at the end of 2002.

Beginning in 1999, the survey was conducted in the northern territories in alternating years. Therefore, for the 2000 and 2002 editions of this publication, Canada-level totals include the 10 provinces only. In the 1998, 1999 and 2001 editions of this publication, totals for Canada include the territories. The 2003 survey will include the northern territories.

All expenditure values quoted in this release are in current dollars.

This report is organized into the following sections:

- Five analytical articles covering recent trends; the effect of income on spending patterns; regional variations (with a focus on Toronto, Montréal and Vancouver metropolitan areas); spending patterns, dwelling characteristics and household equipment for different types of households; and a new article about trends in principal energy sources for household heating.
- Graphs for each summary level expenditure category by province and metropolitan area.
- Data tables presenting information for provinces, metropolitan areas, income quintiles, housing tenure and various types of households. These tables present information at the summary level, but are also available on a cost recovery basis at the detailed level (see Table 8) upon request.
- Survey notes and definitions. A more detailed User Guide (Catalogue No. 62F0026MIE) is available free of charge by visiting the Statistics Canada web site (www.statcan.ca). See Related Products and Services for information about obtaining this guide.

We welcome your comments, questions, and suggestions for future articles. Please contact Client Services at: income@statcan.ca or 1-888-297-7355.

1. Starting with the 1997 reference year, the Survey of Household Spending replaced the Family Expenditure Survey and the Household Facilities and Equipment Survey. See Note to former users of data from the Family Expenditure Survey and Note to former users of data from the Household Facilities and Equipment Survey (Catalogue No. 62F0026MIE) for more information.

Recent Trends¹

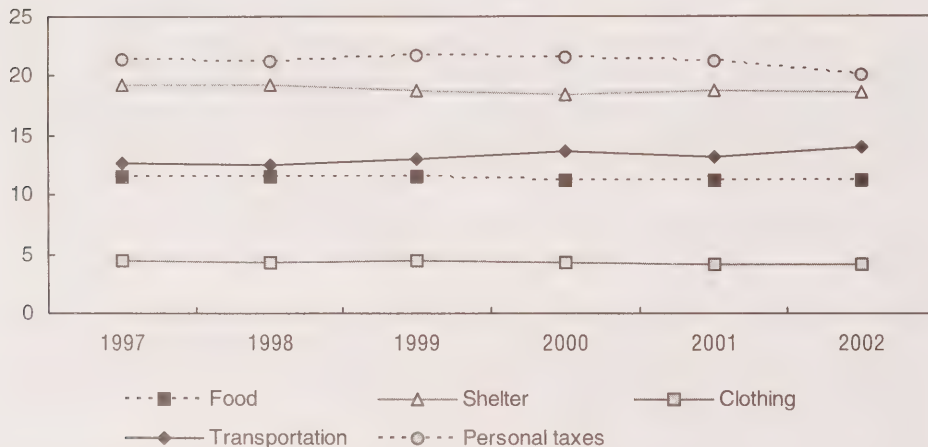

Between 2001 and 2002, average household spending in Canada rose by 4.5 %, from \$57,500 to \$60,100. This increase was higher than the rate of inflation recorded for 2002 (2.2%) as measured by the Consumer Price Index (CPI). It was also higher than the increase in average household income (2.2%).

The proportion of the household budget allocated to the largest spending categories remained largely unchanged. On average, personal taxes claimed 20% of the household budget, a slight decrease from 2001. Remaining stable in comparison with the previous year, shelter accounted for 19% of the household budget, clothing 4.1% and food 11%. In contrast, the portion of the budget that went to transportation increased slightly to 14%.

Graph 1.1

Budget share on major spending categories, Canada, 1997-2002

% of budget

Note: Statistics include the ten provinces only.

Spending on transportation increased in 2002

Households spent an average of \$8,400 on transportation in 2002, up 11% from 2001. This rise can be attributed primarily to the 14% increase in spending on cars and trucks, notably sport-utility vehicles and vans.

1. All expenditures referred to in this chapter are in current dollars. Moreover, all comparisons between 2001 and 2002 are based on averages for the 10 provinces only (excluding the territories). As a result, the 2001 data presented in this chapter will differ from the totals found in the main tables of the 2001 publication.

Table 1.1

Budget share by summary-level spending category, Canada, 1997-2002

Games of chance (net)	0.5	0.5	0.5	0.5	0.5	0.5
Reading materials and other printed matter	0.6	0.5	0.5	0.5	0.5	0.5

Note: Statistics include the ten provinces only.

1. For 2001 only, extra questions were included in the survey so that data from the SHS could be used in the weighting of the Consumer Price Index. This change may affect historical comparisons for a few variables. For example, additional questions were added under "Personal care". As a result, respondents may have given more precise information and the increase in the estimate for "Personal care" may have been at least partly caused by an improvement in respondent recall. See "User Guide" (section: Comparability over time) for additional information.

Moreover, spending on gasoline and other vehicle fuels rose 11% in 2002, to an average of \$2,000 for households that reported such purchases. It should be noted that, according to the CPI, average gasoline prices decreased slightly in 2002.

Average spending on public transportation, which includes airfare as well as local and intercity transport, rose by 7.5% in 2002 to \$700.

The increase in spending on transportation can also be attributed to increased spending on public and private insurance premiums for motor vehicles, which jumped by 16% in 2002 compared with the previous year. Average household spending in this area totalled \$1,100.

Spending on shelter increased in 2002

In 2002, households spent an average of \$11,200 for shelter during the year, representing a 4.3% rise compared with the \$10,700 spent the previous year. This increase can be attributed largely to higher costs for owner-occupied dwellings, particularly for regular mortgage payments, utilities and property taxes.

In 2002, average spending on the three major utilities (water, fuel and electricity) by households that reported such expenditures was up 4.5%, from an estimated \$2,000 in 2001 to \$2,100 in 2002.

Among homeowners, 38% reported expenditures for maintenance, repairs and equipment replacement in 2002. The reporting households spent an average of \$1,400 in 2002, compared with \$1,500 the previous year. Payments on property taxes for households reporting them rose by 3.4% in 2002 to \$2,000.

Average spending on fuel, such as oil and natural gas, was up 4.9% to \$1,100 in households reporting such spending. Expenditure reported for electricity was \$1,200, a 3.1% increase since the previous year. As measured by the CPI, the price of electricity climbed 7.7% in 2002 compared with 2001.

The 2002 data reveal that approximately 50% of Canadian households used natural gas² as their principal heating fuel, while 32% used electricity and 13% used oil. These figures vary from one province to the next depending on the availability of the various types of fuel.

Spending on food also up

Households spent an average of \$6,700 on food in 2002, a 3.9% increase from the previous year. On average, each household spent approximately \$5,200 on food purchased from stores, representing a 4.2% increase since 2001.

The increase in spending on food can also be attributed in part to higher costs for restaurant meals, which rose 2.7% to \$1,500. Expenditures related to food services³ accounted for 22% of all spending on food.

Household spending on health care and for pension plans was higher

In 2002, average household spending on health care in Canada climbed by 12% to \$1,600. This increase can be explained partly by higher spending on health insurance premiums, which rose by 13% between 2001 and 2002. The average premium for households reporting such expenditures (55%) in 2002 was estimated at \$1,000. Health insurance premiums include payments for public health insurance or drug insurance plans where applicable, as well as payments for private health insurance plans, including coverage for dental care and accident or disability insurance.

Household spending on personal insurance and pension plan contributions, with the exception of registered retirement savings plans, climbed by 9.3% to \$3,400 in 2002, notably because of higher premiums for the Canada Pension Plan and the Quebec Pension Plan. Average contributions to an RRSP fell by 4.2%, to \$1,600 in 2002 compared with 2001.

Increase in spending on games of chance and tobacco products

At the national level, net expenditures on games of chance rose by close to 18% from 2001 to an average of \$300 per household.

Spending on tobacco products shot up 19% to reach an average of \$700 in 2002. However, this total largely reflects a 32% increase in the price of tobacco products as measured by the Consumer Price Index. Over the past 10 years, the percentage of households that reported expenditures on tobacco products has dropped, from 47% in 1992 to 39% in 2002.

Little change in household spending on personal taxes

The average household spending on personal taxes showed no significant change, decreasing only slightly to \$12,000 in 2002, compared to \$12,200 the previous year. The proportion of the average household budget represented by personal taxes in 2002 was 20%, the corresponding figure for 2001 being 21%.

2. Also includes households that use bottled gas as their main heating fuel. However, such households make up a negligible percentage of the total.

3. Includes meals purchased at restaurants, drive-throughs, cafeterias, establishments that sell take-out food, mobile canteens, catering services and hotels.

Table 1.2

Average expenditure per household by summary-level spending category, Canada, 2001-2002

	2001 \$ current	2002 \$ current	Percent Difference
Games of chance (net)	266	313	17.7
Gifts of money and contributions	1,259	1,444	14.7
Tobacco products and alcoholic beverages	1,310	1,478	12.8
Health care	1,421	1,590	11.9
Transportation	7,596	8,431	11.0

Personal taxes	12,217	12,025	-1.6
Personal care	960	829	-13.6 ¹
Total expenditure	57,482	60,090	4.5

Note: Statistics include the ten provinces only.

1. For 2001 only, extra questions were included in the survey so that data from the SHS could be used in the weighting of the Consumer Price Index. This change may affect historical comparisons for a few variables. For example, additional questions were added under "Personal care". As a result, respondents may have given more precise information and the increase in the estimate for "Personal care" may have been at least partly caused by an improvement in respondent recall. See "User Guide" (section: Comparability over time) for additional information.

Computers and the Internet becoming more popular with Canadians

The use of home computers has skyrocketed in recent years. At the end of 2002, 64% of Canadian households reported that they had a home computer, compared with 60% in 2001, 55% in 2000 and only 10% in 1986, the first year in which such data were compiled.

Internet access at home has grown even more quickly. In 2002, more than half of all households indicated that they used the Internet at home (54%), as contrasted with 50% in 2001, 42% in 2000 and only 7.4% in 1996, the first year when data were compiled on this subject. Households that reported expenditures on Internet services spent an average of \$400 in 2002, up from \$300 in 2001.

In addition, more than half of the households with Internet access reported using a high-speed connection (high-speed cable or telephone) in 2002, up from 41% compared with 2001.

The downward trend observed since 1996 with respect to the amount spent by households on computer equipment continued in 2002. In 2002, average spending by reporting households decreased to \$1,200, or 7.2% less than in 2001. Prices for computer equipment and supplies in 2002, as measured by the Consumer Price Index, plunged by 18% from 2001. For 2002, 21% of households reported expenditures for computer equipment, a percentage similar to those reported for 2000 (20%) and 2001 (22%). In comparison, 13% of households had reported such expenditures in 1996 and only 3.0% in 1986.

Graph 1.2

Percentage of households with computer and Internet access, Canada, 1986-2002

Note: Statistics include the ten provinces only.

Graph 1.3

Percentage of Households Reporting Spending on Computer Hardware, Canada,

Note: Statistics include the ten provinces only.

The majority of Canadian households had a cell phone

Cell phone use has been growing consistently since 1996—the first year for which data were compiled on this subject. The percentage of households that have a cell phone rose from 48% in 2001 to 52% in 2002. On average, households spent \$300 on cell phone services in 2002, 25% more than in 2001.

Long-term trends in ownership of home entertainment equipment...

Over the past two decades, Canadian households have adopted a wide variety of home entertainment equipment. The colour television continues to hold universal appeal: over 99% of households owned at least one in 2002. The percentage of households that subscribe to cable television services has been continually decreasing since 1999, when 73% of households subscribed to such services, compared with 67% in 2002. Satellite television receivers were reported in 21% of households, up from 18% in 2001.

Graph 1.4

Percentage of Households with Cell Phones, Canada, 1996-2002

Note: Statistics include the ten provinces only.

At the end of 2002, the percentage of households that owned videocassette recorders and compact disc players was 92% and 74% respectively.

Graph 1.5

Percentage of households with selected home entertainment equipment, Canada, 1984-2002

Note: Statistics include the ten provinces only.

DVD players and CD burners are becoming increasingly popular. Approximately 36% of households reported having a DVD player and 28% a compact disc burner, as compared with approximately 20% for each type of equipment in 2001.

Graph 1.6
Percentage of households with new technology equipment, Canada, 2001-2002

Note: Statistics include the ten provinces only.

...and household appliances

There has been slow but steady growth for most household appliances since 1984. The microwave oven, which was adopted more quickly and on a wider scale than more costly or less portable items such as air conditioners, dishwashers and washing machines, is the exception.

Graph 1.7
Percentage of households with selected home appliances, Canada, 1984-2002

Note: Statistics include the ten provinces only.

The effect of income level

In 2002, households in the lowest income quintile¹ spent an average of \$20,200, while households in the top quintile spent \$120,200. For households in the lowest quintile, just over half the budget went to food, shelter and clothing (\$10,500). In contrast, households in the highest quintile devoted \$33,200, or slightly more than a quarter of their budget, to these three necessities. Personal taxes made up 28% of the upper quintile's budget, compared with just 3.8% for lowest-quintile households. For all Canadian households combined, personal taxes took a slightly smaller share of the budget in 2002 than in 2001, whereas for households in the lowest quintile, they accounted for a slightly larger proportion in 2002.

While there was a substantial difference in transportation expenditures between the lowest and highest quintiles (\$2,400 for the former and \$16,000 for the latter), the budget share allocated to transportation was similar for all income levels.

Graph 2.1

Percentage of household budget spent on major spending categories, by income quintile, Canada, 2002

Adjusting spending data for household size gives a different perspective

Household spending patterns are affected not only by income but also by household size. On average, higher income households are larger than lower income households. Households in the lowest quintile averaged 1.5 persons, while those in the highest quintile averaged 3.5 persons. Furthermore, people living alone made up 61% of lowest-quintile households but only 2.8% of highest-quintile households.

1. An income quintile is a grouping based on income level obtained by ranking households in ascending order of total household income and dividing them into five groups such that the estimated number of households in each group is the same.

Table 2.1

Average household expenditure by income quintile, Canada, 2002

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
			\$		
Food	3,504	5,061	6,614	7,874	10,369
Shelter	6,145	8,249	10,474	13,220	17,930
Clothing	860	1,429	2,099	2,930	4,932
Transportation	2,437	5,514	8,005	10,209	15,991
Personal taxes	774	3,583	7,967	14,037	33,764
Other categories ¹	6,502	11,790	17,473	23,471	37,242
Total expenditure	20,222	35,625	52,633	71,741	120,227

1. "Other categories" includes all remaining spending categories such as furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

When adjusted for household size,² the estimated average expenditures of households in the upper quintile declined from six times the expenditures of lowest-quintile households to just under four times.

Table 2.2

Average household expenditure adjusted for household size, by income quintile, Canada, 2002

	Lowest quintile	2nd quintile	3rd quintile	4th quintile	Highest quintile
			\$		
Food	2,891	3,500	4,121	4,436	5,317
Shelter	5,070	5,704	6,526	7,448	9,195
Clothing	710	988	1,308	1,651	2,529
Transportation	2,010	3,813	4,988	5,752	8,200
Personal taxes	639	2,478	4,964	7,908	17,315
Other categories ¹	5,365	8,154	10,886	13,222	19,099
Total expenditure	16,685	24,637	32,793	40,417	61,655

1. "Other categories" includes all remaining spending categories such as furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

Graph 2.2

Total household expenditure unadjusted and adjusted for household size, by income quintile, Canada, 2002

2. The household size adjustment used reflects the principle that family needs increase with family size. The adult equivalence scales chosen were the same used for the Low Income Measures (LIM, Catalogue No. 13-582). Each additional adult is assumed to increase the family's needs by 40% of the needs of the first adult, and each child's needs are assumed to be 30% of that of the first adult. One exception is for households composed of one adult and one or more children. In that case, the first child is assumed to increase the family's needs by 40%, instead of 30%. The following adult equivalent household sizes were used to adjust the expenditure data by quintile (lowest to highest quintile): 1.212, 1.446, 1.605, 1.775 and 1.950.

When estimates adjusted for household size are used, the highest-income households spent twice as much as the lowest-income households on basic necessities such as food and shelter. On clothing, the highest income households spent nearly four times more than the lowest income households. Conversely, in the areas of personal taxes, households in the top income group spent 27 times more than households in the lowest income group, and in the areas of insurance and pension plan premiums, 16 times more.

Graph 2.3

Spending Ratio adjusted for household size, highest to lowest income quintile, Canada, 2002

Aside from household size, there are other significant differences between households in the highest and lowest income quintiles. For example, 91% of upper-quintile households have one or more full-time earners, compared with only 11% of lowest-quintile households. Only 5.3% of households in the top quintile have a reference person over the age of 65, compared with 41% of households in the bottom quintile. Moreover, 89% of upper-quintile households are composed of a couple, compared with only 20% of lowest-quintile households.

Highest-income households three times more likely to have a computer

The Survey of Household Spending collects data on the presence of selected types of household equipment, such as home entertainment equipment, communications equipment and household appliances. Households in the highest income quintile are more likely to own such equipment.

Upper-quintile households were three times more likely to have a personal computer or a cell phone than lowest-quintile households, and four times more likely to have Internet access from home.

Nearly all households in the top income quintile reported having a conventional telephone, compared with 94% of households in the bottom quintile. It should also be noted that some households chose to have a cell phone instead of a conventional phone.

Graph 2.4

Percentage of households with selected home entertainment, communication and computer equipment, by selected income quintile, Canada, 2002

Ownership of colour television sets is nearly universal, as 98% of lowest-quintile households reported having one. The number of colour television sets owned increases with income; 82% of upper-quintile households stated that they had two or more colour televisions, compared with 29% of lowest-quintile households. Households in the highest quintile were twice as likely to have a CD player as households in the bottom quintile (93% compared with 48%).

Graph 2.5

Percentage of households with colour televisions by income quintile, Canada, 2002

Type of dwelling may affect equipment ownership

Another factor that may influence what appliances and equipment are present in the home is the type of dwelling. Renters, for example, are less likely to report having appliances such as washers and dryers because such appliances are often available in the building where they live. About 57% of lowest-quintile households lived in apartments, compared with just 11% of top-quintile households. Households in the highest income group were almost twice as likely to have a washer or a dryer as households in the lowest group.

In the case of other appliances such as freezers and dishwashers, space limitations may also be a factor. On average, the dwellings of lowest-quintile households had three fewer rooms than the dwellings of upper-quintile households. The latter were twice as likely to have a freezer and almost four times as likely to have a dishwasher as lowest-quintile households.

Graph 2.6

Percentage of households with selected home appliances by selected income quintile, Canada, 2002

Although ownership rates are higher in the highest income group for most types of equipment, there are exceptions, mostly for appliances that can be replaced with something better. Air conditioners are a case in point: 15% of lowest-quintile households reported having a window air conditioner, compared with only 9.3% of highest-quintile households. Households in the top quintile were nearly five times as likely to invest in a central air conditioner as in a window air conditioner. It is also important to keep in mind that renters tend to use window air conditioners while homeowners are more likely to use a central air system.

Graph 2.7
Percentage of households with air conditioners by income quintile, Canada, 2002

Owning or leasing a vehicle linked to household income

Households in the top income quintile are about twice as likely to own or lease a vehicle as households in the bottom quintile (98% compared with 51%). They are also more likely to own more than one vehicle. At the end of 2002, about 65% of upper-quintile households had two or more vehicles, compared with just 5.9% of lowest-quintile households. Spending on vehicle operating costs also varied from quintile to quintile. For those households that reported operating costs for any vehicles, average expenditures ranged from \$2,200 (bottom quintile) to \$7,000 (top quintile).

Graph 2.8
Percentage of households with vehicles and operational costs, by income quintile, Canada, 2002

Regional patterns

Because of regional characteristics, household spending patterns vary considerably across the country. In 2002, households in Alberta reported higher spending than households in any other province, averaging \$67,700, while households in Newfoundland and Labrador had the lowest average spending, at \$48,000. Household spending was above the national average in Alberta, Ontario and British Columbia.

Graph 3.1

Average household expenditure by province and Canada, 2002

Total expenditures in the major categories – food, shelter, clothing, transportation and personal taxes – accounted for a similar share of the total household budget in every province, ranging from a low of 65% in Saskatchewan to a high of 69% in Quebec.

The share of the household budget spent on food was relatively stable throughout Canada, ranging from 10% in Alberta and Ontario to 13% in Quebec, Newfoundland and Labrador, and Prince Edward Island.

There were greater differences between provinces in the share of the total budget spent on shelter. Households in British Columbia devoted the largest proportion of their budgets to shelter (20%), while households in Newfoundland and Labrador reported the lowest average spending in that category (15%).

Table 3.1
Percentage of household budget spent on major spending categories by province and Canada, 2002

	Food	Shelter	Clothing	Transportation	Personal taxes
	% of budget				
Newfoundland and Labrador	13	15	5	16	17
Prince Edward Island	12	17	4	16	16
Nova Scotia	11	18	4	16	18
New Brunswick	12	16	4	16	18
Quebec	13	17	4	13	21
Ontario	10	20	4	14	21
Manitoba	11	17	4	14	19
Saskatchewan	11	17	4	14	19
Alberta	10	17	4	15	21
British Columbia	11	20	4	14	18
Canada	11	19	4	14	20

Nationally, transportation made up 14% of household budgets. At the provincial level, the proportion varied from 13% in Quebec to 16% in Newfoundland and Labrador.

Personal taxes accounted for the largest share of the budget in Alberta, Quebec and Ontario (21%) and smallest share in Prince Edward Island and Newfoundland and Labrador (17%).

Household spending data were not collected in the three northern territories in 2002.

Calgary households were the biggest spenders

Among the 15 metropolitan areas for which data are available, Calgary reported the highest average spending, \$76,500, followed by Toronto and Ottawa. In 2001, Ottawa households had the highest spending, at \$82,700. The decline in household expenditure in Ottawa was primarily due to a substantial drop in spending on personal taxes.

In 2002, Charlottetown–Summerside had the lowest average spending, at \$45,100. This was unchanged from 2001 in terms of ranking and amount.

Care must be taken when comparing metropolitan data for different years; because of small sample sizes, changes may not be statistically significant. To determine whether a change is statistically significant, please refer to the 2002 SHS User Guide (Catalogue no. 62F0026MIE), which contains information about sampling errors, coefficients of variation and how to use them. Special care must be exercised when using estimates for small subgroups (such as some metropolitan areas) where the sample is less than 200 households.

Focus on the Toronto, Montréal and Vancouver metropolitan areas

Every year, this publication takes a close look at household spending patterns in a particular region of Canada. For the 2002 report, the focus is on the country's three largest metropolitan areas – Montréal, Toronto and Vancouver.

Graph 3.2**Average household expenditure for selected metropolitan areas, 2002**

Toronto households had the highest total spending among Canada's three biggest cities, averaging \$76,000 in 2002. Vancouver households followed with \$66,800, while Montréal households reported average expenditures of \$56,500, below the national average of \$60,100.

Toronto residents spent more on shelter

For all shelter categories combined, Toronto households spend an average of \$15,400 in 2002, compared with \$13,700 for Vancouver households and \$10,200 for Montréal households. It is important to note that although half of Montréal's households were owners in 2002, while 61% of Toronto and Vancouver households owned their residences, the rankings of the three cities remained the same whether shelter costs for either owners or renters were compared.

The situation was somewhat different in the area of property taxes. Toronto households spent the highest amount, \$1,900, on property taxes, while Montréalers spent \$1,400 and Vancouver households averaged \$1,300.

Personal taxes took the largest share of household budgets in Canada's three biggest cities

Montréal and Toronto households' largest outlays were for personal taxes, which made up 23% (\$13,000) and 22% (\$16,700) of their budgets respectively. For Vancouver households, spending on personal taxes accounted for 20% (\$13,200) of their budgets, the same as the national average.

Montréal households spent less on transportation

For all transportation categories combined, Toronto households had higher expenditures, averaging \$9,900, compared with the national average of \$8,400.

Vancouver households spent slightly less on average, at \$9,100. Montréal households, on the other hand, had far lower expenditures than households in the other two metropolitan areas, at \$6,900. This was partly due to the fact that Montréalers spent less on the purchase of automobiles and trucks (\$2,200 compared with \$3,200 and \$3,000 for Toronto and Vancouver households respectively). Spending on gas and other fuels was also lower for Montréal households (\$1,400 compared with \$1,800 and \$1,500 for Toronto and Vancouver households). Another transportation category on which Montréal households spent less was public transportation¹ (\$600 compared with \$1,400 and \$1,200 for Toronto and Vancouver households).

Vancouver households spent more on restaurant food

For all food expenditure categories combined, households in Canada's three largest cities spent more than the national average of \$6,700. The average was \$7,600 for Toronto, \$7,400 for Vancouver and \$6,900 for Montréal. It is worth noting that Vancouver households spent more, on average, for food purchased from restaurants than did households in the other two cities (\$2,000 compared with \$1,800 and \$1,500 for Toronto and Montréal respectively).

Recreation expenditures were highest in Toronto

Average spending on recreation was above the national average of \$3,500 for Toronto and Vancouver households, at \$3,900 and \$3,800 respectively. For households in the Montréal metropolitan area, spending on all recreation categories combined was lower than the national average, at \$3,000.

Toronto households spent twice as much on education as Montréal households

While household spending on education was lower in Montréal² than at the national level (\$700 compared with \$900), Toronto and Vancouver households spent far more on education, averaging \$1,600 and \$1,300 respectively.

Household spending on clothing in Canada's three biggest cities was above the national average

The average amount spent on clothing by households in Toronto (\$3,200), Vancouver (\$2,600) and Montréal (\$2,500) was higher than the national average for clothing expenditure of \$2,450 in 2002. The accessibility and diversity of clothing stores in urban areas probably have something to do with the fact that clothing expenditures are higher for households in these cities.

Montréal and Vancouver households spent more on alcohol

Vancouver and Montréal households reported spending \$800 on alcoholic beverages, an amount higher than the national average of \$750, while Toronto households spent an average of \$700, slightly less than the 2002 national average.

More Vancouver and Toronto households had cell phones

In 2002, cell phones were more popular in Toronto and Vancouver, with 64% of households reported having one for personal use. The corresponding proportion for Montréal households was 52%, the same as the national average.

1. For example, for users who buy a regular monthly pass, public transportation is less expensive in Montréal than in Toronto and Vancouver, according to the rate schedules of the three cities' transportation companies.

2. Postsecondary tuition fees are lower in Quebec than in any other province. For example, for the 2001-2002 academic year, average tuition fees for full-time undergraduate students were \$3,600 at the national level, \$1,800 in Quebec, \$4,500 in Ontario and \$2,500 in British Columbia (Statistics Canada, Tuition and living accommodation costs for full-time students at Canadian degree-granting universities and colleges).

Table 3.2

Average expenditure per household and budget share by summary-level spending category, Canada, Toronto, Montréal and Vancouver metropolitan areas, 2002

	Canada		Toronto CMA		Montréal CMA		Vancouver CMA

Personal care	829	1.4	998	1.3	900	1.6	936	1.4
Games of chance (net)	313	0.5	365	0.5	269	0.5	282	0.4
Reading materials and other printed matter	285	0.5	331	0.4	297	0.5	299	0.4
Total expenditure	60,090	100.0	76,029	100.0	56,462	100.0	66,809	100.0

DVD players were more popular in Vancouver

Almost half of Vancouver households (49%) reported having a DVD player, well above the national average of 36%. Toronto households were less likely to have a CD player than Vancouver and Montréal households. However, the proportion of households that had a DVD player was higher in Toronto (42%) than in Montréal (35%). The versatility of DVD players (it can play videos and CDs) may be partly responsible for the fact that fewer Toronto households have CD players.

CD burners were more common among households in Vancouver (40%) than in Toronto (31%) and Montréal (29%). The national average was 28%.

Satellite dishes were slightly more popular in Montréal

Satellite dishes, generally more widespread in rural areas, were more common in households in the Montréal metropolitan area (14%) than in Toronto (12%) and Vancouver (9%).

Vancouver households were more likely to have a personal computer and access to the Internet at home

More households in the Vancouver metropolitan area had a personal computer than households in the other two cities. In Vancouver, 78% of households had access to a personal computer at home, compared with 75% of Toronto households and 64% of Montréal households. The national average was 64%.

The pattern was the same for Internet use from home. Vancouver households used the Internet more at home (71%) than Toronto households (63%), while Montréal households were about the same as the national average of 54%.

Most Toronto households had an air conditioning system; few Vancouver households did

While 70% of Toronto households had an air conditioning system; only 4.0% of Vancouver households had an air conditioner. The proportion of Montréal households (34%)³ that had an air conditioner was, once again, not far from the national average (38%). Climate may be a significant factor in household facilities and equipment such as air conditioners.

3. The Montréal metropolitan area has a larger proportion of renter households than the Toronto metropolitan area. The fact that owner households are more likely to use an air conditioning system (43%) than renter households (27%) may partly account for the fact that a larger proportion of Toronto households have an air conditioning system.

Spending patterns, dwelling characteristics, and household equipment for selected household types

The daily decisions made about spending and the amounts spent depend on the demographics of the household, such as the household type, income level, size of the household, and age of the members of the household.¹

Graph 4.1

Average Household Expenditure by Type of Household, Canada, 2002

1. "All other expenditures" includes all remaining spending categories such as furniture, communications, child care, recreation education, health care, tobacco and alcohol, and gifts.
2. "Couple households" includes households with and without children.
3. "Other households" includes households composed entirely of relatives (e.g., married sons and daughters) and households having at least one unrelated person.

1. The Notes and definitions section contains complete definitions of the various types of households mentioned in this report.

Couple households with children spend almost twice that of lone-parent households

In 2002, couples with children spent on average \$82,400 compared to \$45,000 for lone-parent households. Approximately 84% of couple households with children included at least one full-time worker compared to only 54% of lone-parent households. Lone-parent households spent a substantially larger proportion of their budget on food, shelter and clothing (40%) than couples with children (32%).

The share of the budget spent by lone-parent households on transportation was only slightly less than that of couple households with children. However, the dollar amount spent was appreciably different. Couples with children spent \$11,700 (14% of their budget) on transportation compared to \$5,700 for lone-parent households (13% of their budget). Couples with children were more likely to own or rent a vehicle than lone-parent households. At the end of 2002, 96% of couples with children owned or rented a vehicle compared to 73% of lone-parent households.

Graph 4.2

Budget share of major spending categories, households with children, Canada, 2002

1. "All other expenditures" includes all remaining spending categories such as furniture, communications, child care, recreation, education, health care, tobacco and alcohol, and gifts.

However, for both lone-parent households and couple households with children, approximately one-third of expenditures were allocated to all expenditures other than those on food, shelter, clothing, transportation and personal taxes.

Couple households with children are more likely to have access to the Internet at home than lone-parent households

At the end of 2002, 77% of couple households with children had access to the Internet at home compared to only 52% of lone-parent households. However, the rate of access to the Internet at home is increasing faster among lone-parent households. Between 2001 and 2002, access to the Internet at home increased by 9.2% for lone-parent households and by 7.5% for couples with children.

Around two-thirds of couple households with children and lone-parent households reported expenditures for cable television services in 2002. However, couples with children were more likely to purchase satellite services with 24% of them reporting this expenditure compared to 13% of lone-parent households.

Nine out of ten couples with children reported buying reading material, such as newspapers, magazines and books; on average reporting households spent \$400. Fewer lone-parent households (79%) reported such expenditures in 2002. Compared to couples with children, lone-parent households spent less on reading material, averaging \$300.

Male and female lone-parent households have different spending patterns

Female lone-parent households represented 82% of all lone-parent households in Canada in 2002. These households allocated a larger proportion of their budget to food, shelter and clothing (42%) than did male lone-parent households (34%).

In contrast, male lone-parent households spent more for all expenditures related to transportation, some 15% of their total budget, compared to a proportion equivalent to 12% for all female lone-parent households. In fact, male lone-parent households spent 76% more on private transportation than female lone-parent households (\$7,800 and \$4,400 respectively).

A higher percentage of male lone-parent households reported owning a vehicle (84%) compared to female lone-parent households (71%). The appreciably higher expenditures on private transportation are due to the costs associated with owning and operating a vehicle, such as vehicle purchases, repairs, maintenance and the purchase of gas and other fuels.

Female lone-parent households made greater use of public transit - 74% reporting these expenditures compared to 61% of male lone-parent households. However, average expenditures for transportation by bus, metro and taxi, as well as for airline travel, were 13% higher for male lone-parent households than for female lone-parent households (\$700 for male lone-parent households and \$600 for female lone-parent households).

The differences in spending patterns were attributable in part to differences in employment and income levels. Approximately 64% of male lone-parent households included a full-time worker in 2002 compared to 46% of female lone-parent households. In addition, the average income before tax reported by male lone-parent households was 32% higher than the average before tax income reported by female lone-parent households.

Female lone-parent households have greater access to the Internet at home

A larger proportion of female lone-parent households has access to the Internet than their male counterparts. Some 53% of female lone-parent households use the Internet at home, while only 48% of male lone-parent households have home Internet access.

A similar proportion (48%) of female and male lone-parent households owned a cell phone.

Graph 4.3

Percentage of households with children having selected entertainment and communications equipment, Canada, 2002

Average expenditures on entertainment were lower in female lone-parent households (\$2,400) than in male lone-parent households (\$3,500). This gap was attributable mainly to differences in expenditures on recreational vehicles² and the use of recreational services. Expenditures by male lone-parent households in this area were much higher than those of female lone-parent households (\$800 compared to \$150).

Shelter represents the largest expenditure for persons of all ages living alone

The largest share of the budget of one-person households was spent on shelter, some 24% compared to the national average of 19%. On average, persons living alone spent \$7,600 on shelter, compared to \$11,200 for all households. Approximately 85% of one-person households rented their dwelling or lived in a residence without a mortgage, compared to 66% for all Canadian households. The shelter costs associated with renting or with being an owner without a mortgage were in general much lower than the costs associated with being the owner of a mortgaged dwelling.

The second largest share of the budget of one-person households was allocated to personal taxes at 18%, a proportion slightly lower than the 20% Canadian average.

One-person households spent 11% of their total budget on food, which is the same as the national average. Average food expenditures were \$4,100 for men and \$3,200 for women. Expenditures on restaurant meals were higher for men in general and for all persons working full time. Moreover, men with a full-time job who were living alone spent 40% of their food budget in restaurants, which is almost double the Canadian average of 22%.

2. Recreational vehicles include the purchase and operation of bicycles, travel trailers, motorcycles, snowmobiles, motor homes, and boats.

Graph 4.4

Share of food budget spent at restaurants by one-person households, Canada, 2002

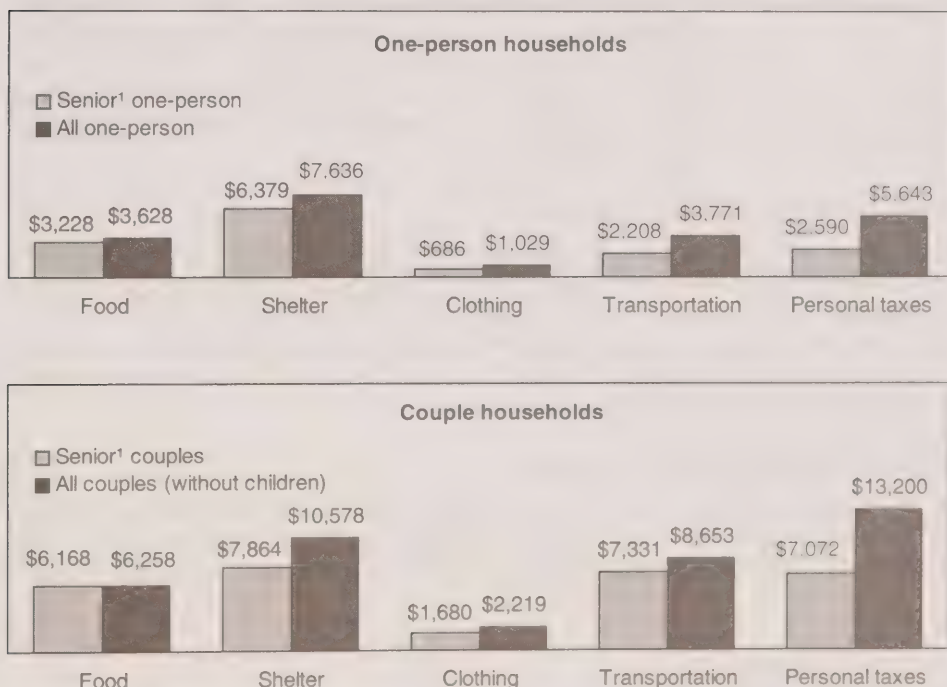

1. Includes individuals aged 65 years or over.

Senior households³ generally spend less

In general, senior households spent less than other types of households. In 2002, senior couple households spent an average of \$46,900 compared to \$60,400 for all couple households without children. Seniors living alone also generally reported lower expenditures than one-person households, spending \$22,400 compared to \$32,100.

Graph 4.5

Average household expenditure for senior households, Canada, 2002

1. Includes individuals aged 65 years or over.

3. Including persons living alone aged 65 or older and couple households in which one of the people is aged 65 or older.

Housing expenditures were generally lower for senior households because they were more likely to live in a mortgage-free dwelling that they owned.⁴ At the end of 2002, 80% of senior couple households and 46% of seniors living alone owned their residence on which the mortgage had been paid off. In comparison, only 28% of all households owned their dwelling mortgage-free.

Graph 4.6

Housing tenure for selected household types, Canada, 2002

1. Includes individuals aged 65 years or over.

As might be expected, fewer senior households than other types of households reported expenditures on education and when it was reported, the amount reported was less. Approximately 12% of senior couple households reported spending an average of \$1,100 on education, while 4.9% of seniors living alone reported average spending of \$800. In comparison, 44% of households reporting expenditures on education spent an average of \$2,100.

Seniors spent less on recreation

At the end of 2002, senior couple households spent \$2,400 on all recreational items, ranging from the use of recreational facilities to the purchase of recreational vehicles to home entertainment equipment, and package travel tours. This amount was less than the national average of \$3,500. However, 98% of senior couple households reported this type of expenditure, as often as all Canadian households, but they spent less on average.

Seniors gave more gifts of money

Senior couple households reported spending twice as much as the national average on gifts of money and contributions to charity: \$2,900 on average (6.1% of the household budget) compared to \$1,400 (2.4% of the average household budget).

4. Canadian households that owned their dwelling and did not have a mortgage are those that spent the least on housing, that is, \$7,300 on average compared to \$8,400 for households that rented their housing and \$17,200 for households that owned their dwelling but that had not finished paying off the mortgage.

Senior men living alone spent more than senior women

Senior men living alone spent \$30,200 compared to \$20,000 for their female counterparts, which reflects in part the gap in their average incomes. In this regard, the gap in total expenditures between genders for seniors living alone has risen sharply, climbing from 22% in 2001 to 51% in 2002.

Senior men spent three times as much on transportation as senior women (\$4,500 compared to \$1,500). While senior men were more likely to own or rent a vehicle than senior women (73% compared to 44%), senior women, like female lone-parent households, used public transit more frequently, 65% reporting this type of expenditure compared to 51% for senior men.

Senior women spent more on personal care, clothing and health care, while senior men spent more on recreation, tobacco products and alcoholic beverages, reading and other printed materials, and gambling.

Trends in principal energy sources for household heating

This chapter, the first of its kind in this series of publications, is primarily about patterns in the main energy source that Canadian households use to heat their dwellings.

In 2002, the average expenditure on fuel, such as oil and natural gas, for households that reported such expenses, was \$1,100, up 4.8% from 2001. Spending on electricity was \$1,200, up 3.1% from the previous year. According to the CPI, electricity prices were up 7.7% in 2002 compared with 2001.

Graph 5.1

Average expenditure per household reporting on fuel and electricity, Canada, 2001-2002

Half of Canadian households heated their homes with natural gas¹

According to 2002 data, about 50% of households in Canada used natural gas as their principal energy source for heating, compared with 32% for electricity and 13% for oil.

Provincial figures varied with the availability of the different fuels. The small number of households in each of the four Atlantic provinces that reported using natural gas as their principal energy source reflects the lack of availability of that fuel in those provinces. On the other hand, households in the western provinces and Ontario used natural gas as a principal energy source. Among these provinces, Manitoba had the lowest proportion with 58%, while 97% of Albertan households reported using natural gas.

¹ Also includes households that use bottled gas as their main heating fuel. However, such households make up a negligible percentage of the total.

Electricity was the leading energy source for heating in Quebec, New Brunswick, and Newfoundland and Labrador (68%, 56% and 50% respectively).

In contrast, most Prince Edward Island and Nova Scotia households used oil. It was the principal method of heating for 81% and 60% of the provinces' households, respectively.

Wood and fuels other than natural gas, electricity and oil² were used by 6% of households. These heating sources were used in higher proportion in the Atlantic provinces; they were the primary heating method for 20% of households in New Brunswick, 17% in Newfoundland and Labrador, 15% in Prince Edward Island and 13% in Nova Scotia.

Graph 5.2

Principal energy source used for heating by province and Canada, 2002 (percentage of households reporting)

2. Wood was the principal fuel in this category.

Differences in energy source used for heating were also evident between metropolitan areas

Almost all households in Regina, Saskatoon, Calgary and Edmonton used natural gas as the principal source of energy for heating their residences. In each of these cities, over 95% of households reported natural gas as their main fuel. A majority of Toronto, Winnipeg, Vancouver and Ottawa households also used natural gas (81%, 76%, 71% and 66% respectively).

Electricity was the predominant heating method for households in Québec City, Montréal, St. John's (N.L.), Saint John (N.B.), and Victoria where 76%, 73%, 66%, 63% and 51% of households reported using this source.

Oil was by far the leading fuel used for residential heating in Charlottetown–Summerside (92% of all households). In Halifax, 64% of households used oil as their main source of energy for heating.

Graph 5.3

Principal energy source used for heating, selected metropolitan areas and Canada, 2002 (percentage of households reporting)

Graph 5.3

Principal energy source used for heating, selected metropolitan areas and Canada, 2002 (percentage of households reporting) – concluded

* Insufficient number of households reporting.

Renters more likely to heat with electricity

The survey results also indicate that the principal source of energy used for heating also varies with tenure. Renters are twice as likely as owners to use electricity as their main source of energy for heating.

In 2002, about 46% of the estimated 4.1 million renter households heated with electricity, compared with only 24% of owners. Meanwhile, some 55% of the 7.6 million owner households reported using natural gas as their primary energy source for heating, compared with 41% of renters.

In contrast, oil was used by fairly similar proportions of renters and owners. In 2002, the proportion of households using oil was between 11% and 13% for both tenure types.

As might be expected, wood and other less common fuels were mostly used by owner households. Specifically, 7.8% of owner households reported heating their homes primarily with wood and other fuels, compared with only 1.8% of renter households.

Graph 5.4

Principal energy source used for heating, by tenure, Canada, 2002 (percentage of households reporting)

Lowest-quintile households more likely to heat with electricity

Electricity was the leading source of energy used for heating by the lowest-income households: 44% of them used electricity, compared with only 20% of upper-quintile households. This is probably due in part to the fact that the majority (63%) of lowest-quintile households are renters, compared with only 13% of the top-quintile households.

The leading heating fuel used by the highest-income households was natural gas (reported by 67% of them). In comparison, 39% of the lowest-quintile households reported using natural gas as their main energy source for heating.

Graph 5.5

**Principal energy source used for heating, by income quintile, Canada, 2002
(percentage of households reporting)**

While there were substantial differences between the highest and lowest income quintiles in their use of electricity and natural gas as the principal source of energy for heating, the use of oil varied less across the five income groups, ranging between 10% and 15%.

Wood and other less common energy sources were used most by middle-quintile households (8.5%), while top- and bottom-quintile households were less likely to use them (about 4.0% each).

Both natural gas and electricity used for hot water supply

Roughly the same proportion of Canadian households (47%) reported natural gas and electricity as the main source of energy for hot water supply in their homes. Owners were somewhat more likely to use natural gas (51%) for hot water heating, while a slight majority of renters used electricity (52%).

Electricity was by far the dominant source of energy used by Canadian households for cooking (93%). Natural gas was reported by only 6.3%. There was a slight difference between owners and renters in the main source of energy they used for cooking: electricity was used by 91% of owners and 97% of renters.

1. Based on full-year households only (see "The survey universe" under "Notes and definitions").

2. Based on full-year and part-year households (see "The survey universe" under "Notes and definitions").

3. Quintiles are created by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same. In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household which falls on the threshold between two quintiles represents a number of households, some of which would be allocated to the quintile and some to the other. (For this reason, the upper threshold for one quintile is repeated as the lower threshold for the next quintile.) Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four units.

1. Based on full-year households only (see "The survey universe" under "Notes and definitions").

2. Based on full-year and part-year households (see "The survey universe" under "Notes and definitions").

3. Lone-parent households consist of a parent and one or more single, never-married children of any age.

4. "Related persons" includes children who are no longer single, never-married and other relatives by birth or marriage.

5. Unrelated persons are household members who are not related to the reference person (e.g., lodgers and room-mates).

Table 7
Housing tenure, Canada (10 provinces), 2002
Household characteristics¹

	Owners (full year)			Renters (full year)	Mixed Tenure in 2002
	All owners	Without mortgage	With mortgage

Table 7

Housing tenure, Canada (10 provinces), 2002 – concluded
Household equipment (at December 31)²

	Owners (full year)			Renters (full year)	Mixed Tenure in 2002
	All owners	Without mortgage	With mortgage		
Number of households in sample	9,663	5,035	4,628	4,610	431
Estimated number of households	7,573,160	3,660,950	3,912,210	4,096,170	351,690
Household appliances					
Washing machine	97.6	97.4	97.8	49.4	85.9
Clothes dryer	95.5	94.3	96.7	47.2	84.6
Dishwasher	70.9	66.3	75.1	23.6	55.3
Refrigerator	100.0	100.0	99.9	99.6	99.7
Freezer	72.3	76.6	68.2	30.4	39.5
Microwave oven	95.4	93.4	97.2	86.2	98.1
Air conditioner	43.2	43.0	43.4	27.3	33.0
Window air conditioner	10.4	9.8	11.0	20.5	12.4
Central air conditioner	32.8	33.3	32.4	6.8	20.6
Communication & home entertainment equipment					
With a telephone (regular or cellular)	99.8	99.7	100.0	96.6	99.9
Telephones (includes business use)	99.3	99.3	99.4	92.6	99.4
1	13.0	14.4	11.6	39.7	21.9
2	30.6	30.4	30.8	34.4	45.4
3 or more	55.7	54.4	56.9	18.5	32.1
Cellular telephone	57.0	48.3	65.2	40.7	61.0
Compact disc player	77.3	67.6	86.3	66.5	79.4
Cablevision	65.4	63.6	67.1	68.4	67.4
Satellite dish	26.9	26.4	27.3	10.6	25.9
DVD player	38.6	29.1	47.6	30.1	39.4
CD writer	30.8	23.4	37.7	21.1	35.8
Video cassette recorders	94.9	91.9	97.8	86.8	92.5
1	53.9	57.0	51.1	67.7	64.8
2 or more	41.0	34.9	46.7	19.1	27.8
Home computer	70.1	58.7	80.7	52.0	69.4
Internet use from home	60.8	50.6	70.3	41.9	57.8
Type of Internet connection					
Regular telephone connection to a computer	29.3	27.5	31.0	17.5	21.7
High-speed telephone connection to a computer	14.5	10.9	17.9	11.7	15.9
Cable connection to a computer	16.7	11.9	21.1	12.3	20.1
Other type of connection	F	F	F	F	F
Colour televisions	99.6	99.5	99.7	98.4	99.4
1	27.7	30.8	24.7	58.6	43.1
2	39.4	39.6	39.1	27.8	38.4
3 or more	32.6	29.2	35.8	12.0	17.9
Vehicles					
With a vehicle (owned or leased)	94.1	91.2	96.9	64.3	92.1
Owned vehicles (automobiles, trucks and vans)	89.7	88.2	91.1	59.4	84.8
1	41.9	43.4	40.5	46.4	46.8
2 or more	47.8	44.8	50.6	13.1	38.1
Owned automobiles	71.8	71.6	72.0	48.4	70.0
1	51.4	52.4	50.6	41.2	51.9
2 or more	20.3	19.2	21.4	7.2	18.0
Owned vans and trucks	45.9	43.2	48.5	16.9	31.6
1	36.9	34.5	39.2	15.6	24.2
2 or more	9.0	8.7	9.2	1.3	7.5
Leased vehicles (automobiles, trucks and vans)	11.3	7.4	15.0	6.8	10.6

1. Based on full-year households only (see "The survey universe" under "Notes and definitions").

2. Based on full-year and part-year households (see "The survey universe" under "Notes and definitions").

Table 8

 Detailed spending categories, average expenditure per household, percentage reporting, average expenditure per household reporting, and percentage of total expenditure, Canada (10 provinces), 2002¹

		Average expenditure per household	Percentage reporting	Average expenditure per household reporting ⁴	Percentage of total expenditure
		\$	%	\$	%
1000-5230	Total expenditure	60,090	100.0	60,090	100.0
1000-4840	Total current consumption	43,206	100.0	43,206	71.9
1000-1560	Food	6,684	100.0	6,684	11.1
1000-1520	Food purchased from stores	5,181	100.0	5,181	8.6
1000	Locally or on day trips	5,091	100.0	5,091	8.5
1520	While on trips overnight or longer	90	30.1	299	0.1
1530-1532	Board paid to private households	32	4.4	740	0.1
1530	Board paid by household members including roomers	19	3.5	525	0.0
1532	While on trips overnight or longer	14	1.0	1,368	0.0
1560	Food purchased from restaurants	1,471	94.8	1,552	2.4
2000-2052	Shelter	11,204	99.9	11,218	18.6
2000-2034	Principal accommodation	10,542	99.8	10,561	17.5
2000-2002	Rented living quarters	2,530	35.9	7,055	4.2
2000	Rent	2,460	35.6	6,914	4.1
2001	Tenants' maintenance, repairs and alterations	30	5.6	538	0.1
2002	Tenants' insurance premiums	40	15.5	259	0.1
2010-2028	Owned living quarters	6,149	67.6	9,091	10.2
2010	Regular mortgage payments	3,409	36.6	9,319	5.7
2011	Maintenance, repairs and replacements	537	38.1	1,408	0.9
2012	Condominium charges	119	5.2	2,312	0.2
2014	Property taxes	1,343	66.9	2,006	2.2

1. Based on full-year households only (see "The survey universe" under "Notes and definitions").

2. Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

3. Values are presented here as a negative expenditure.

4. "Average expenditure per household reporting" was calculated using unrounded data. Note also that expenditures in this column do not add to sub-totals.

Notes and definitions

Survey methodology

The survey universe

The 2002 Survey of Household Spending was carried out in private households in Canada's 10 provinces.¹

The following groups were excluded from the survey:

- those living on Indian reserves and crown lands;
- official representatives of foreign countries living in Canada and their families;
- members of religious and other communal colonies;
- members of the Canadian Armed Forces living in Military Camps;
- people living in residences for senior citizens; and
- people living full time in institutions: for example, inmates of penal institutions and chronic care patients living in hospitals and nursing homes.

The survey covers about 98% of the population in the 10 provinces.

Information was not gathered from persons temporarily living away from their families (for example, students at university), because it would be gathered from their families if selected. In this way, double counting of such individuals was avoided.

Data from part-year households were excluded from estimates of average household spending. However, these data were included in the estimates for dwelling characteristics and household equipment and in the calculation of the Survey of Household Spending response rate. Data from part-year households are also required as input into Canada's System of National Accounts. Part-year households are composed entirely of persons who were members of other households for part of the reference year. There were 475 part-year households in the sample in 2002.

Survey content and reference period

Detailed information was collected about expenditures for consumer goods and services, changes in assets, mortgages and other loans, and annual income. This information was collected for the calendar year 2002 (the survey reference year). Information was also collected about dwelling characteristics (e.g., type and age of heating equipment) and household equipment (e.g., appliances, communications equipment, and vehicles). This type of information was collected as of December 31st of the reference year.

1. In order to reduce response burden for northern households, the SHS is conducted in the north only every second year, starting in 2001.

Because the Survey of Household Spending is designed principally to provide detailed information on non-food expenditures, only an overall estimate of food expenditure is recorded. Detailed information on food expenditure is provided by the Food Expenditure Survey, which is conducted every four to six years. It was last conducted in 2001. In February 2003, the results were published in *Food Expenditure in Canada, 2001*, Catalogue no. 62-554-XIE.

The sample

The sample size for the 2002 Survey of Household Spending was 20,861 eligible households.

This sample was a stratified, multi-stage sample selected from the Labour Force Survey (LFS) sampling frame. Sample selection comprised two main steps: the selection of clusters (small geographic areas) from the LFS frame and the selection of dwellings within these selected clusters. The LFS sampling frame mainly uses 1991 Census geography and 1991 population counts.²

Data collection

The 2002 Survey of Household Spending was conducted from January to March 2003. Data were collected during a personal interview using a paper questionnaire. A copy of this questionnaire is available on request.

Data processing and quality control

Data entry and automated editing for the 2002 Survey of Household Spending took place in the Statistics Canada regional offices. This allowed respondents to be contacted in the event that more information was required to resolve an inconsistency on their questionnaires.

After data entry, an automated physical edit system checked for data entry errors. Data had to pass a two-tier edit system consisting of "must-pass" edits that checked questionnaires for logic and consistency, and "warnings" that indicated that a particular situation was unusual and could require correction. Either type of edit resulted in the intervention of a member of one of the specially trained edit resolution teams. Further editing of the data took place in head office where invalid responses were corrected.

Missing responses were imputed using the nearest neighbour method. Statistics Canada's Canadian Census Edit and Imputation System (CANCEIS) was used to insert values from donor records having similar characteristics, chosen specifically to fit the variable. For example, total household income was used for most variables; dwelling type, household size and province were also frequently used.

Tabulation for the 2002 Survey of Household Spending was accomplished using a PC/client server-based system. This system provides tools (database querying, searching, and viewing capabilities) for spotting systematic errors.

Weighting

The estimation of population characteristics from a sample survey is based on the premise that each sampled unit represents a certain number of units in the population. A basic survey weight was attached to each record in the sample to reflect this

2. A detailed description of the Labour Force Survey sampling frame can be found in Methodology of the Canadian Labour Force Survey, Statistics Canada, Catalogue no. 71-526-XPB.

representation. These basic weights were adjusted for non-response for selected metropolitan areas, additional geographical areas and for high-income strata. The additional geographical areas comprise the remaining metropolitan areas and urban and rural areas based on census definitions but do not necessarily correspond exactly. For definitions of these terms, refer to the *1996 Census Dictionary*, Catalogue no. 92-351-XPE.

To increase the reliability of the estimates, weights were adjusted to ensure that estimates based on relevant characteristics of the population would respect population totals from sources other than the survey. For the 10 provinces, there are two sets of totals.

The first set of totals, for age/sex groups, household size and household type at the province level, is based on projections at mid-January 2003 using the 1996 Census of Population (adjusted for net undercoverage). Controls for 18 age/sex groups are used. These are combined with totals for one-person households, two-person households and more than two-person households. There are also totals for the number of single-parent families and couples with never-married children. Finally, for the 14 selected metropolitan areas, only two age groups were used: number of persons under 18, and number of persons 18 and over.

The second set of totals is derived from T4 information from Canada Customs and Revenue Agency (CCRA, formerly Revenue Canada) and is intended to ensure that the weighted distribution of income (based on wages and salaries) in the data set matches that of the Canadian population.

The switch from 1991 to 1996 Census-based population totals and the use of T4 information from CCRA were introduced starting with the 1999 SHS. Revised SHS estimates for earlier survey years are available and should be used for year-over-year comparisons.

Data quality

Sampling error

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The sample design, the variability of the data, and the sample size determine the size of the sampling error. In addition, for a given sample design, different methods of estimation will result in different sampling errors.

The design for the 2002 Survey of Household Spending was a stratified multi-stage sampling scheme. The sampling errors for multi-stage sampling are usually higher than for a simple random sample of the same size. However, the operational advantages outweigh this disadvantage, and the fact that the sample is also stratified improves the precision of estimates.

Data variability is the difference between members of the population with respect to spending on a specific item or the presence of a specific dwelling characteristic or piece of household equipment. In general, the greater these differences are, the larger the sampling error will be. In addition, the larger the sample size, the smaller the sampling error.

Standard error and coefficient of variation

A common measure of sampling error is the standard error (SE). Standard error is the degree of variation in the estimates as a result of selecting one particular sample rather than another of the same size and design. It has been shown that the "true" value of the characteristic of interest lies within a range of ± 1 standard error of the estimate for 68% of all samples, and ± 2 standard errors for 95% of all samples.

The coefficient of variation (CV) is the standard error expressed as a percentage of the estimate. It is used to indicate the degree of uncertainty associated with an estimate. For example, if the estimate of the number of households having a given dwelling characteristic is 10,000 households, and the corresponding CV is 5%, then the "true" value is between 9,500 and 10,500 households, 68% of the time and between 9,000 and 11,000 households, 95% of the time.

Standard errors for the 2002 Survey of Household Spending were estimated using the jackknife technique, which leads to a slight over-estimation and is, thus, conservative. For more information, refer to the Statistics Canada publication, *Methodology of the Canadian Labour Force Survey*, Catalogue no. 71-526-XPB.

Coefficients of variation are available in the User Guide for the Survey of Household Spending, 2002. This is available free of charge by special request (call Client Services, Income Statistics Division, 1-888-297-7355; income@statcan.ca) and also at the Statistics Canada web site (www.statcan.ca). On the "Our products and services" page, choose "Free Internet publications"; then "Personal finance and household finance"; then "Household expenditure research papers series" (Catalogue no. is 62F0026MIE).

Data suppression

For reliability reasons, estimates with CVs greater than 33% should be suppressed. Since CVs are not calculated for all estimates, data suppression for the Survey of Household Spending has been based on a relationship between the CV and the number of households reporting expenditure on an item. Analysis of past survey results indicates that CVs usually reach this level when the number of households reporting an item drops to about 30. Therefore, data have been suppressed for spending on items reported by fewer than 30 households.

However, data for suppressed items do contribute to summary level variables. For example, the expenditure for a particular category of clothing might be suppressed but this amount forms part of the total expenditure estimate for clothing.

Non-sampling error

Non-sampling errors occur because certain factors make it difficult to obtain accurate responses or responses that retain their accuracy throughout processing. Unlike sampling error, non-sampling error is not readily quantified. Four sources of non-sampling error can be identified: coverage error, response error, non-response error, and processing error.

Coverage error

Coverage error results from inadequate representation of the intended population. This error may occur during sample design or selection, or during data collection and processing.

Response error

Response error may be due to many factors, including faulty design of the questionnaire, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. In the Survey of Household Spending, the difference between receipts and disbursements is calculated as a check on respondents' recall. This important quality control tool involves the balancing of receipts (income and other money received by the household) and disbursements (total expenditure plus the variable *Money flows—assets, loans, and other debts*) for each questionnaire. If the difference is greater than 10% of the larger of receipts or disbursements, respondents are contacted again for additional information. This ensures that expenditures, at least at the aggregate level, match household income and other sources of funds.

Several features of the survey help respondents recall their expenditures as accurately as possible. First, the survey period is the calendar year because it is probably more clearly defined in people's minds than any other period of similar length. Second, expenditure on food (about 11% of the average budget in 2002) can be estimated as either weekly or monthly expenses depending on the respondent's purchasing habits. Third, expenses on smaller items purchased at regular intervals are usually estimated on the basis of amount and frequency of purchase. Purchases of large items (automobiles, for example) are recalled fairly easily, as are expenditures on rent, property taxes, and monthly payments on mortgages. However, even with these items, the accuracy of data depends on the respondent's ability to remember and willingness to consult records.

Non-response error

Non-response error occurs in sample surveys because not all potential respondents cooperate fully. The extent of non-response varies from partial non-response to total non-response.

Total non-response occurs when the interviewer is unable to contact the respondent, no member of the household is able to provide information, or the respondent refuses to participate in the survey. Total non-response is handled by adjusting the basic survey weight for responding households to compensate for non-responding households. For the 2002 Survey of Household Spending, the overall response rate was 70.5%. See Figure 1 for provincial response rates.

In most cases, partial non-response occurs when the respondent does not understand or misinterprets a question, refuses to answer a question, or is unable to recall the requested information. Imputing missing values compensates for this partial non-response.

The importance of the non-response error is unknown but in general this error is significant when a group of people with particular characteristics in common refuse to cooperate and where those characteristics are important determinants of survey results.

Processing error

Processing errors may occur in any of the data processing stages, for example, during data entry, editing, weighting, and tabulation. See Data processing and quality control (above) for a description of the steps taken to reduce processing error.

Figure 1
Response rates, Canada and provinces, 2002

	Eligible households ¹	Non-contacts	Refusals	Un-usables ²	Usables	Response rate ³
						%
Newfoundland and Labrador	1,681	130	224	70	1,257	74.8
Prince Edward Island	799	36	115	11	637	79.7
Nova Scotia	2,063	148	429	119	1,367	66.3
New Brunswick	1,766	115	349	63	1,239	70.2
Quebec	2,760	193	571	7	1,989	72.1
Ontario	3,159	307	738	128	1,986	62.9
Manitoba	1,858	95	296	24	1,443	77.7
Saskatchewan	1,963	105	338	19	1,501	76.5
Alberta	2,105	144	417	52	1,492	70.9
British Columbia	2,707	219	514	181	1,793	66.2
Canada	20,861	1,492	3,991	674	14,704	70.5

1. Part-year households are included in the calculation of response rates. There were 475 part-year households in 2002.

2. Rejected at the editing stage.

3. Usable/eligible*100.

The effect of large values

For any sample, estimates can be affected by the presence or absence of extreme values from the population. These extreme values are most likely to arise from positively skewed populations. The nature of the subject matter of the SHS lends itself to such extreme values. Estimates of totals, averages and standard errors may be greatly influenced by the presence or absence of these extremes.

Comparability over time

Conducted since 1997, the Survey of Household Spending integrates most of the content found in the Family Expenditure Survey and the Household Facilities and Equipment Survey. Many variables from these two surveys are comparable to those in the Survey of Household Spending. However, some differences related to the methodology, to data quality and to definitions must be considered before making comparisons.

The mortgage payment calculation has been revised for the years from 1997 to 2001. This has resulted in downward revisions for those years in the following expenditure categories: "Regular mortgage payments", "Owned living quarters", "Principal accommodation", "Shelter", "Total current consumption", and "Total expenditure". The effect of the revision has been an average decrease of about 0.5% in "Total expenditure" for those years.

For more information, refer to *Note to former users of data from the Family Expenditure Survey*, Catalogue no. 62F0026MIE2000002 and *Note to former users of data from the Household Facilities and Equipment Survey*, Catalogue no. 62F0026MIE2000003. Both documents are available free of charge on the Statistics Canada web site (www.statcan.ca).

Historical data from the 1997 and 1998 Surveys of Household Spending, the 1996 Family Expenditure Survey and the 1996 Household Facilities and Equipment Survey have been re-weighted using the weighting methodology described in the section "Weighting". Historical comparisons between data from those surveys and data from recent years of the Survey of Household Spending should generally be made with re-weighted data, although the differences between survey estimates from the old and new methodologies appear to be minimal at a summary level. Certain populations or variables, however, may be more strongly affected.

For the 2001 survey, extra questions were included for use in the weighting of the Consumer Price Index. This change may affect some historical comparisons. For example, in 2001 questions were added under "Personal care" to collect extra information about hair care products, makeup, fragrances, deodorants and oral hygiene products. As a result of these extra questions, respondents may have given more precise information and the increase in the estimated expenditures for "Personal care" in 2001 may have been caused by an improvement in respondent recall. The effect of additional questions on estimates is difficult to quantify. However, in 2002 when the extra questions were removed, the estimate for Personal care spending decreased again.

Definitions

General concepts

Survey universe: The 2002 Survey of Household Spending has two reference periods and therefore two survey universes. Expenditure data are collected for the calendar year 2002. Dwelling characteristics and data about household equipment are collected as of December 31, of the reference year.

Tabulation: Expenditure data are tabulated for full-year households only. Dwelling characteristics and household equipment data are tabulated for full-year and part-year households.

Household: A person or group of persons occupying one dwelling unit is defined as a "household". The number of households, therefore, equals the number of occupied dwellings. A full-year household has at least one full-year member; a part-year household is composed entirely of part-year members.

Household member: A full-year member was a member of the household for the entire year. A part-year member was a member of the household for less than 52 weeks. Expenditure and income information for part-year members is collected for the portion of the year during which they were members of the household or members of another household no longer in existence.

Reference person: The household member being interviewed chooses which household member should be listed as the reference person after hearing the following definition. "The household reference person is the member of the household mainly responsible for its financial maintenance (e.g., pays the rent, mortgage, property taxes, electricity). This person can be either male or female. When all members of the household share equally, any member may be shown as the reference person." This person must have been a member of the household on December 31st of the reference year.

Reimbursed expenditures are excluded from the tabulations (e.g., work-related expenses or expenditures covered by insurance).

Expenses attributable to a business are excluded from the tabulations.

Negative expenditures: Certain values (*Separate sale of automobiles and trucks*, *Winnings from games of chance*, and *Tax refunds*) are presented in the data tables as "negative expenditures" since they represent a flow of money into the household instead of out of it.

Expenditures collected: With some minor exceptions, the survey includes spending on all goods and services *received* in 2002 whether paid for before or after 2002 (such as on an installment plan).

Taxes included: All expenditures include the Goods and Services Tax, provincial retail sales taxes, tips, customs duties and any other additional charges or taxes.

Gifts: Any expenditure may include gifts given to persons outside the household. Only the value of gifts of clothing is reported separately, as well as being included in the summary clothing category. See also the definition of "Gifts of money and contributions".

Insurance settlements: Where an insurance settlement was used to repair or replace property, the survey includes only the deductible amount paid for an item.

Trade-ins: Where a trade-in is used to lower the price of an item, most commonly a vehicle, the expenditure amount is the total cost after the trade-in. Real estate transactions are excepted.

Household characteristics

(Presented in the same order as they appear on the data tables.)

Number of households in sample refers to the number of households used for data estimation, which includes the number of households sampled, minus vacant dwellings, ineligible households, households that interviewers were unable to contact, households that refused to be interviewed, and households whose questionnaires did not pass editing procedures. For expenditure data tables, only full-year households are included. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included. See *Household* under "General concepts".

Estimated number of households is the estimated (weighted) number of private households on December 31st of the reference year. For expenditure data tables, the estimate is based on full-year households only. For tables presenting dwelling characteristics and household equipment, both full-year and part-year households are included in the estimate. See *Household* under "General concepts".

Average household size is the average number of people in a household. In this context, household size is defined as the number of year-equivalent persons. The number of year-equivalent persons is calculated by dividing the number of weeks that members were part of the household by 52. In this way, part-year members are counted as fractions of a year-equivalent person.

Average household income before tax includes total household income received in calendar year 2002, including gross income from wages and salaries, net income from self-employment, receipts from military pay and allowances, gross receipts from roomers and boarders not related to the reference person, net rentals, interest and dividends, all pensions, workers' compensation and employment insurance benefits, social assistance and income supplements, Child Tax Benefits, Goods and Services Tax Credits, provincial tax credits, Harmonized Sales Tax credits, and miscellaneous regular income receipts.

Other money receipts refers to other receipts not included in income such as cash gifts, inheritance, or life insurance settlements. Winnings from games of chance are also included if they exceed the amount spent on games of chance.

Money flows—assets, loans and other debts includes net changes during the reference year (calendar year 2002) in bank balances; money on hand; money owed to the household; money owed by the household; purchase and sale of stocks and bonds, personal property, and real estate; expenditures on home additions, renovations and new installations; and contributions to and withdrawals from registered retirement savings plans.

The Family Expenditure Survey, last conducted in 1996, had a similar variable called *Average net change in assets and liabilities*. For a complete description of the differences between the two variables, see *Note to Former Users of Data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website (www.statcan.ca).

Percentage homeowners (at December 31) is the percentage of households living in a dwelling owned (with or without a mortgage) by a member of the household at December 31st of the reference year.

Average age of reference person acts as a general age indicator for the household and uses the reference person's age in years as of December 31st. Prior to 1996, in the Family Expenditure Survey, the age of the husband was used for couple households and the age of the reference person for all other households. See *Reference person* under "General concepts".

Selected household expenditures

(Presented in the same order as they appear on the data tables.)

Total expenditure includes *Total current consumption*, *Personal taxes*, *Personal insurance payments and pension contributions*, and *Gifts of money and contributions*.

Caution should be used when comparing total expenditure to total expenditure from 1996 and earlier. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website (www.statcan.ca).

Total current consumption shows the expenses incurred during the reference year for food, shelter, household operations, household furnishings and equipment, clothing, transportation, health care, personal care, recreation, reading materials, education, tobacco products and alcoholic beverages, games of chance, and a miscellaneous group of items.

Caution should be used when comparing total current consumption to total current consumption from 1996 and earlier. Prior to 1997, expenditures for gifts were not included in total current consumption. Starting in 1997, these expenditures are reported in the appropriate spending category and therefore contribute to total current consumption. See also "Shelter" and "Miscellaneous".

Food purchased from stores: "Stores" includes frozen food provisioners, outdoor farmers' markets and stands, and all other non-service establishments.

Food purchased from restaurants: "Restaurants" includes refreshment stands, snack bars, vending machines, mobile canteens, caterers and coffee wagons.

Shelter includes expenditures on principal accommodation (either owned or rented) and on other accommodation such as vacation homes or accommodation while travelling.

Expenditure on owned principal accommodation includes regular mortgage payments, if any. This definition of shelter differs from that of the Family Expenditure Survey last conducted in 1996. See *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website (www.statcan.ca).

Rent refers to the net household expense for rent after adjusting for rebates and for any use of the dwelling for business. No adjustment for partial subletting to non-household members is made. Receipts from this activity are considered part of household income.

Tenants' insurance/Homeowners' insurance are the premiums paid in 2002 for fire and comprehensive policies. Premiums covering more than the reference year were not prorated.

Maintenance, repairs and replacements (owned living quarters) covers expenditures for work contracted out, labour cost, and materials purchased separately for all types of maintenance, repairs and replacements. This variable includes expenditures on built-in appliances and other equipment and fixture replacements. Money spent on additions, renovations and new installations is considered to contribute to an increase in assets and is included in *Money flows—assets, loans and other debts*.

An annual data series from 1987 to 2002 (exception of 2000) showing household expenditures on repairs and renovations is available from the Homeowner Repair and Renovation Survey (HRRS). However, this survey was cancelled permanently in 2003. The HRRS had been an annual source of detailed estimates of repairs and renovations expenses. See *Homeowner Repair and Renovation Expenditure*, Catalogue no. 62-201.

Property taxes and sewage charges refer to the amount billed, excluding any rebates. Special service charges (e.g., garbage, sewage), local improvements, and water charges are included if these are part of the property tax bill. Property taxes that are included in condominium charges are excluded.

Electricity: Respondents sometimes report household electricity payments together with their water and sewage payments. This affects estimates of average household expenditure and percentage reporting for "Electricity" and "Water and sewage". The summary category "Water, fuel and electricity" is unaffected.

Traveller accommodation excludes accommodation that was part of a travel tour (which is included in *Package travel tours*).

Household appliances refers to the net purchase price after deducting trade-in allowance and any discount. This variable excludes appliances included in the purchase of a home and built-in appliances. Expenditures on household fixtures (e.g., built-in appliances and wall-to-wall carpeting) can be reported under the appropriate expenditure item or, if they were part of a larger job, *under Additions, renovations etc. to a home, or Maintenance, repairs and replacements*.

Purchase of automobiles and trucks refers to the net purchase price, including extra equipment, accessories, and warranties bought when the vehicle was purchased, after deducting any trade-in allowance or separate sales. (Separate sales occur when a vehicle is sold independently by the owner, e.g., not traded-in when purchasing or leasing another vehicle.)

Health care includes direct (out-of-pocket) costs and expenditures on insurance premiums. The distinction between premiums for private health insurance plans and publicly funded (provincial) plans is not always clear to respondents. Interviewers are trained to assist, but the variations in coverage and administration among the various provincial health care regimes makes this a difficult task. For this reason, more confidence can be placed in the overall estimate for *Health insurance premiums* than in the components: *Public hospital, medical and drug plans* and *Private health insurance plans*.

Package travel tours includes at least two components such as transportation and accommodation, or accommodation with food and beverages.

Tobacco and smokers' supplies includes cigarettes, tobacco, cigars, matches, pipes, lighters, ashtrays, cigarette papers and tubes, etc. Purchases of tobacco products and smokers' supplies are frequently under-reported.

Alcoholic beverages includes those purchased from stores and restaurants. Also included are expenditures on supplies and fees for self-made beer, wine or liquor. Purchases of alcoholic beverages are frequently under-reported.

Games of chance (net) equals the sum of expenditures on all types of games of chance minus the sum of winnings from all types of games of chance. If total winnings are greater than total expenditures, the amount to be subtracted from expenditures is set to \$1 less than the expenditures and the value of the remaining winnings is moved to the variable *Other money receipts*. Expenditures on games of chance are frequently under-reported.

Miscellaneous expenditures includes expenses on other owned property (not principal accommodation or vacation home), legal services not related to dwellings, financial services, dues to unions and professional associations, contributions and dues for social clubs and other organizations, forfeits of deposits, fines, money lost or stolen, the purchase of tools and equipment for work, and other miscellaneous goods and services.

Caution should be used when comparing current data for *Miscellaneous expenditures* to data from the Family Expenditure Survey (1996 or earlier). For a complete description of the differences between the two variables, see *Note to former users of data from the Family Expenditure Survey* (62F0026MIE2000002) available free on the Statistics Canada website (www.statcan.ca).

Personal taxes are income taxes paid in 2002 on 2002 and previous years' incomes plus other personal taxes (e.g., gift taxes, Newfoundland and Labrador school tax) minus income tax refunds received in 2002. Tax credits, such as Federal Child Tax Benefits, Goods and Services Tax Credits and provincial tax credits, are included in *Average household income before taxes*.

Personal insurance payments and pension contributions includes payments for life insurance, annuities, employment insurance, public and private pension plans, and similar items. For certain uses of the data, some of these items might be regarded as savings, although the relationship between the expenditure and any increase in savings may not be easily determined. This category of expenditure was called *Security* prior to the 1996 survey. (Registered retirement savings plan (RRSP) contributions are included in *Money flows—assets, loans and other debts*.)

Gifts of money and contributions includes money and support payments given to persons outside the household or to charity. This does not include money spent on gifts to persons outside the household as was the case in the Family Expenditure Survey.

Alimony: This variable is available starting in 1998. Before 1998, expenditures on alimony were included under *Gifts of money and other support payments to persons living inside Canada* or *Gifts of money and other support payments to persons living outside Canada*.

Dwelling characteristics

(Dwelling characteristics are collected as of December 31st)

Type of dwelling describes the type of dwelling in which the household resided on December 31st. A dwelling is a structurally separate set of living premises with a private entrance from outside the building or from a common hall or stairway.

A *single detached* dwelling contains only one dwelling unit and is completely separated by open space on all sides from any other structure, except its own garage or shed.

A *single attached* dwelling is a double or semi-detached unit (side-by-side) or a row or terrace unit.

The classification *apartment* includes duplexes (two dwellings, situated one above the other), triplexes, quadruplexes or apartment buildings.

Other dwellings include mobile homes, motor homes, tents, railroad cars or house-boats, which are used as permanent residences and are capable of being moved on short notice.

Repairs needed: This variable indicates the respondent's perception of the repairs the dwelling needed on December 31st to restore it to its original condition. Remodeling, additions, conversions, or energy improvements that would upgrade the dwelling over and above its original condition are not included.

Major repairs include serious deficiencies in the structural condition of the dwelling, as well as the plumbing, electrical and heating systems. Examples include corroded pipes, damaged electrical wiring, sagging floors, bulging walls, damp walls and ceilings, and crumbling foundation.

Minor repairs include deficiencies in the surface or covering materials of the dwelling and less serious deficiencies in the plumbing, electrical and heating systems. Examples include small cracks in interior walls and ceilings, broken light fixtures and switches, cracked or broken panes, leaking sinks, missing shingles or siding, and peeling paint.

Regular maintenance includes painting, fixing leaking faucets, clogged gutters or eavestroughs, etc.

Tenure: This variable gives the housing status of the household on December 31st. Note that housing tenure may also refer to the entire reference year. See "Housing tenure" under "Classification categories for standard tables".

Owned with mortgage indicates that the dwelling is owned by a household member and that there is a mortgage as of December 31st.

Owned without mortgage indicates that the dwelling is owned by a household member and that there is no mortgage as of December 31st.

Rented indicates that the dwelling is rented by the household for the entire reference year or occupied rent-free as of December 31st.

Year of move refers to the year the household moved into the dwelling. If the dwelling was occupied by previous generations, the first year of residence for the household member who has occupied the dwelling the longest is recorded.

Period of construction (for dwelling occupied on December 31st) gives the year or period in which the original building was constructed.

Number of rooms (for dwelling occupied on December 31st) includes the kitchen, bedrooms, and finished rooms in the attic or basement. It excludes bathrooms, halls, vestibules and rooms used solely for business purposes.

Number of bathrooms (for dwelling occupied on December 31st) indicates the number of rooms in the dwelling with an installed bathtub and/or shower.

Principal heating equipment (for dwelling occupied on December 31st) indicates the type of heating equipment chiefly used to heat the dwelling in winter.

Steam or hot water furnaces distribute central heating through radiators located throughout the house and connected by pressure pipes.

Forced hot air furnaces distribute central heating by a motor-driven fan through vents located throughout the dwelling. (This is the most common central heating system.) Furnaces with a pump are included in this category.

Other hot air furnaces distribute central heating by convection (natural) flow of hot air through vents located throughout the house. Gravity furnaces are included in this category.

Heating stoves are localized heating units with no central distribution system to other parts of the house (e.g., oil space heater, gas space heater, wood stoves).

Electric heating includes permanently installed baseboard electric heating and other types such as floor or ceiling heating wires in all or most rooms.

Other heating includes cookstoves and any other type of heating equipment not listed above.

Age of principal heating equipment installed (for dwelling occupied on December 31st) indicates how long ago the principal heating equipment was installed.

Principal heating fuel (for dwelling occupied on December 31st) refers to the winter fuel used in the principal heating equipment is given here (e.g., oil or other liquid fuel, piped or bottled gas, electricity, wood or other fuels).

Principal heating fuel for hot water (for dwelling occupied on December 31st) indicates the type of fuel used for the running hot water supply (e.g., oil or other liquid fuel, piped gas, electricity or other fuels such as bottled gas or wood).

Principal cooking fuel (for dwelling occupied on December 31st) indicates the main fuel for the range or stove on which the household does most of the cooking (e.g., piped gas, electricity or other cooking fuels). "Other" includes oil or other liquid fuel, bottled gas and wood.

Household equipment (at December 31st)

In general, appliances and equipment are included if they are in working order or will soon be repaired, and are located within the dwelling occupied on December 31st. They must be owned or leased for the exclusive use of the household.

Washing machine: Washing machines located outside the dwelling and shared with other households are excluded.

Clothes dryer: Dryers may be electric or gas. Clothes dryers located outside the dwelling and shared with other households are excluded.

Dishwasher: Dishwashers may be built-in or portable.

Freezer: A freezer is an individual piece of equipment and not part of a refrigeration unit such as the freezer in a refrigerator.

Air conditioner: A central air conditioner is designed to cool the air in the entire building and may be located either inside or outside the dwelling unit, for example, in the basement of an apartment block. A window-type air conditioner is installed in a window or through a wall to cool the air in a room.

Telephone (includes business use): Telephones used for business are included if the business is conducted in the dwelling. Cordless phones are included. Cell phones are excluded.

Cell phone: Cordless phones are excluded.

Compact disc player: A compact disc player may be a separate unit, part of a component or built in (as in a receiver/cassette recorder/compact disc combination unit).

Video cassette recorder: Video cassette recorders (VCRs) are units which play videocassettes when attached to a television or monitor.

Home computer: Computers used exclusively for business purposes are not included.

Internet use from home indicates whether the household accesses the Internet via a computer in the house. It includes cases where a home computer is used to link to a business computer located outside the dwelling for access to the Internet. Excluded are cases where the Internet is accessed directly through a computer located outside the dwelling (e.g., work).

Type of Internet connection: "Other type of connection" includes telephone line connected to a television and wireless (e.g., cell phone, personal digital appliance).

Owned vehicles gives the number of vehicles (car, van/mini-van, truck/sport utility vehicle) owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned automobiles gives the number of automobiles owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Owned vans or trucks gives the number of vans, minivans, trucks and sport utility vehicles owned by members of the household on December 31st completely or partially for private use, excluding those leased.

Classification categories for standard tables

Canada: In 1998, 1999, and every second year thereafter starting with 2001, statistics for Canada include the territories. For the other years, Canada-level statistics include the 10 provinces only.

Province/territory refers to the major political divisions of Canada. Data for territories are available for 1997 (coverage insufficient for inclusion in Canada-level statistics), 1998, 1999 and every second year thereafter starting with 2001.

Metropolitan Areas: The overall concept for delineating metropolitan areas is one of a large urban area together with adjacent urban and rural areas that have a high degree of social and economic integration with this urban area (See the *1996 Census Dictionary*, p. 181, Catalogue no. 92-351-XPE.)

For the Survey of Household Spending, data are tabulated based on the 1996 census metropolitan area (CMA) boundaries. In the Survey of Household Spending, only data for the Ottawa, Ontario part of the Ottawa–Gatineau CMA are tabulated for the metropolitan area. The data for the Gatineau, Quebec part are included in the data tabulated for the province of Quebec and Canada (10 provinces). Also, the municipality of Selkirk is included in the Survey of Household Spending metropolitan area of Winnipeg, whereas it is not included in the CMA of Winnipeg.

In 2002, the metropolitan areas for which the data are tabulated are: St. John's, Charlottetown–Summerside, Halifax, Saint John, Québec City, Montréal, Ottawa, Toronto, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver and Victoria.

Income: Readers requiring official income statistics are directed to the publication *Income in Canada*, Catalogue no. 75-202.³ In the SHS, income quintiles are used as classifiers in the data tables. In addition, *average household income before tax* is a descriptive household characteristic found at the beginning of each expenditure table (see definition above under "Household characteristics").

Household income quintiles are income groupings obtained by ranking households in ascending order of total household income and partitioning the households into five groups such that the estimated number of households in each group is the same.

In a quintile table, the number of households in the sample for "All classes" is four households higher than the actual number of households in the sample. This is because the sampled household which falls on the threshold between two quintiles represents a number of households, some of which would be allocated to the lower quintile and some to the higher. Since there are four thresholds between quintiles, the number of households in the sample for "All classes" in a quintile table increases by four.

Custom tabulations of other income percentiles and various income groups are available subject to data quality restrictions. Contact Client Services at 1-888-297-7355 or income@statcan.ca.

Housing tenure refers to whether a household member owned or rented the dwelling(s) in which the household lived during the reference year (calendar year 2002). See also "Tenure" under "Dwelling Characteristics".

All owners refers to households living for the entire reference year in a dwelling owned (with or without mortgage) by a household member. See also "Percentage homeowners (December 31st)" under "Household characteristics".

Owners without mortgage owned the dwelling for the entire reference year and had no mortgage on December 31st.

3. Traditionally, the Survey of Consumer Finances (SCF) has been the source of Statistics Canada's annual income estimates. Starting with data for the 1998 reference year, the Survey of Labour and Income Dynamics (SLID) became the major source of annual cross-sectional income estimates, in addition to producing longitudinal income data.

Owners with mortgage owned the dwelling for the entire reference year and had a mortgage on December 31st.

Renters rented a dwelling for the entire reference year (as a regular tenant, rent free, or with reduced rent).

Mixed tenure includes those households that both owned and rented during the reference year.

Household type: Households are divided into the following types:

Couple households are households where the married or common-law spouse of the reference person was a member of the household on December 31st. This household type may be further broken down into couple households without children (without additional persons), with children (without additional persons), and with additional persons. "Children" are never-married sons, daughters, or foster children of the reference person and may be any age. "Additional persons" include sons, daughters and foster children whose marital status is other than "single, never-married", other relatives by birth or marriage, and unrelated persons.

Lone-parent households are households where no spouse of the reference person is present and there is at least one child (never-married son, daughter, or foster child of the reference person). The lone-parent households for which data are presented in this publication do not include any additional persons.

Other households may be broken down into households composed of relatives only and households having at least one unrelated person. Relatives may include:

- sons, daughters and foster children of the reference person whose marital status is other than "single, never-married";
- relatives of the reference person by birth or marriage (not spouse, son, daughter, or foster child);
- spouse of the reference person who was not present in the household on December 31st;
- other households having at least one household member who is unrelated to the reference person (e.g., lodger, roommate, employee).

Size of area of residence: Sampled dwellings are assigned to the following groups depending on the 1996 population size (according to the 1996 census boundaries) of the metropolitan area, municipality, or area in which they are located.

Urban

- 1,000,000 and over
- 500,000 – 999,999
- 250,000 – 499,999
- 100,000 – 249,999
- 30,000 – 99,999
- under 30,000

Rural

Urban area: For the Survey of Household Spending (based on the LFS sampling frame), urban areas include:

- all large metropolitan areas (even though they do contain some rural areas);
- most small metropolitan areas (also called census agglomerations). In some cases, where a census agglomeration contains a large rural population, only the urban portion is considered urban;

- urban areas based on the census definition: Urban areas have minimum population concentrations of 1,000 and a population density of at least 400 per square kilometre, based on the previous census population counts.

Rural area: All territory outside urban areas is considered rural. Taken together, urban and rural areas cover all of Canada.

Statistics presented in the standard tables

Average expenditure per household is equal to the estimated total expenditures of all households divided by the estimated number of households. The average is based on all households in a column, including households that reported a zero value.

Percentage reporting is the percentage of households that reported purchasing an item. These percentages cannot be added together to form sub-totals.

Average expenditure per household reporting is calculated for those households that reported the expenditure, i.e., without zero values.

Percentage of total expenditure is calculated by expressing the average expenditure per household as a percentage of total expenditure. This statistic is also known as "budget share".

Related products and services

Detailed tables

The information in this publication represents only a summary of the results available from the 2002 Survey of Household Spending. The following standard tables are also available:

62F0031	Detailed average household expenditure for Canada, provinces and selected metropolitan areas
62F0032	Detailed average household expenditure by household income quintile for Canada and provinces
62F0033	Detailed average household expenditure by housing tenure for Canada
62F0034	Detailed average household expenditure by household type for Canada
62F0035	Detailed average household expenditure by size of area of residence for Canada
62F0041	Dwelling characteristics and household equipment for Canada, provinces and selected metropolitan areas
62F0042	Dwelling characteristics and household equipment by income quintile for Canada
62F0043	Dwelling characteristics and household equipment by housing tenure for Canada
62F0044	Dwelling characteristics and household equipment by household type for Canada
62F0045	Dwelling characteristics and household equipment by size of area of residence for Canada

Custom tabulations

Custom tabulations can be produced to your specifications on a contract basis (subject to confidentiality restrictions). Aggregate data at the detailed expenditure level (including both full-year and part-year households) are also available on a custom basis.

Public-use microdata file

A public-use microdata file based on the 2002 survey is available. It contains household spending data, as well as data on household characteristics, dwelling characteristics, household facilities and equipment, and income for over 14,700 records. All records have been thoroughly screened to ensure the anonymity of respondents.

Public-use microdata files presenting spending data from previous family expenditure surveys are available for the following years: 1969, 1978, 1982, 1984, 1986, 1990, 1992 and 1996. Public-use microdata files presenting spending data from the surveys of household spending, 1997-2001, are also available. As well, public-use microdata files presenting dwelling characteristics and household facilities and equipment data from previous household facilities and equipment surveys are available for every survey year since 1982 except 1983.

Household expenditures research papers series

This series provides detailed documentation on issues, concepts, methodology, data quality and other relevant research related to household expenditures from the Survey of Household Spending, the Homeowner Repair and Renovation Survey, and the Food Expenditure Survey.

Examples of these research papers include the user guides for the Survey of Household Spending, 1992-2002; data quality indicators for the Survey of Household Spending, 1998-2001; and the Methodology of the Survey of Household Spending.

These research papers are available in English and French, free of charge, on the Statistics Canada web site (www.statcan.ca).

CANSIM

CANSIM (the Canadian Socio-Economic Information Management System) is a data base consisting of multi-dimensional cross-sectional tables.

Eighteen tables are available. They present annual information from the Survey of Household Spending about the spending habits of Canadian households by province and territory. These tables cover the survey years 1997 to 2002.

Table 203-0001 presents summary-level data, while tables 203-0002 to 203-0018 present detailed information.

Client services

For clients with more specialized data needs, custom tabulations can be produced on a cost-recovery basis. For more information or to enquire about the concepts, methods, data quality or the product line, contact Client Services (1 888 297-7355 or 613 951-7355; income@statcan.ca), Income Statistics Division.
